SECTION 1: INTRODUCTION

This report reviews economic data on the cost of raising children and uses it to prepare an updated child support schedule for Rhode Island. Rhode Island is currently reviewing its guidelines. Federal regulation (45 C.F.R. § 302.56) requires states to review their guidelines at least once every four years. As part of that review, states must consider economic data on the cost of raising children and make changes if appropriate. This report documents Rhode Island’s compliance with the federal requirement. It also documents the economic basis of the updated child support schedule favored by the Task Force reviewing the child support guidelines.

Rhode Island promulgates its schedule of basic child support obligations through Administrative Orders of the Rhode Island Family Court.¹ The core of the guidelines calculation is a schedule that specifies the basic support obligation depending on the combined income of the parents and the number of children. It is based on economic evidence on the cost of raising children. Exhibit 1 provides an excerpt of the existing schedule. The support obligation is determined by prorating the payer-parent’s share of the basic obligation. For example, if the income of the paying-parent is \$3,000 per month and the income of the receiving-parent is \$2,000 per month, the combined monthly income is \$5,000 per month. The basic obligation for a combined monthly income of \$5,000 for one child, based on Exhibit 1, is \$841 per month. This reflects economic data on how much parents would spend on the child together if they lived in the same household and shared financial resources. The amount for which each parent is financially responsible is based on each parent’s prorated share of \$841. The payer-parent’s prorated share of the parents’ combined net income is 60% (i.e., \$3,000 divided by \$5,000), which is \$505 per month (60% multiplied by \$841). This is the basis of the child support obligation, although there may be additional adjustments for other considerations such as joint/shared physical custody.

Exhibit 1: Excerpt of Schedule of Basic Obligations

Combined Monthly Income	One Child	Two Children	Three Children
4800.00	818	1255	1500
4850.00	824	1264	1513
4900.00	829	1272	1527
4950.00	835	1281	1540
5000.00	841	1290	1553
5050.00	847	1299	1566
5100.00	853	1308	1579
5150.00	859	1317	1592
5200.00	865	1326	1605
5250.00	870	1334	1618
5300.00	876	1343	1630
5350.00	882	1352	1642
5400.00	889	1362	1653

The economic study underlying the existing Rhode Island schedule was conducted in 2010 using expenditures data collected from families in 2004–2009.² As discussed in more detail later, that study was recently updated using more current expenditures data. It is used as the basis of an updated schedule. Besides the underlying economic study on child-rearing expenditures, there are several other

¹ See Administrative Orders 2007-03 and 87-2, as well as the most recent amended orders: Rhode Island Family Court issued Administrative Order 2018-01 and 2018-02. The orders can be retrieved from the State of Rhode Island Department of Human Services Office of Child Support website: <https://ocss.ri.gov/attorney-info/child-support-guidelines>.

data considerations in the development of a child support schedule and its subsequent update. Due to the time lags between when expenditure data is collected, analyzed, published, and available for use in a child support schedule, the study of child-rearing expenditures underlying the current schedule was updated to January 2017 prices, which was the most current price level data available when Rhode Island began deliberating an updated child support schedule for its last guidelines review. The measurements of child-rearing expenditures, which reflect national levels, were also adjusted for Rhode Island housing prices; federal and state income taxes and FICA (i.e., 2017 tax rates were used for the existing schedule); and to include a low-income adjustment. Tax rates are considered because they affect how much spendable income parents have for their children. Expenditure decisions are made generally based on after-tax income. Federal regulation (45 C.F.R. § 302.56(1)(c)(ii)) requires a state's guidelines to consider the subsistence needs of the payer-parent through a low-income adjustment such as a self-support reserve (SSR). Rhode Island meets the federal requirement by incorporating a SSR into its schedule. The current schedule incorporates a SSR equivalent to the 2017 federal poverty guidelines (FPG) for one person. In short, there are several factors that could be updated in creating an updated schedule appropriate for Rhode Island.

RHODE ISLAND CHILDREN AND CHILD SUPPORT

Child support is an important source of income to many Rhode Island children. Based on the U.S. Census American Community Survey, 207,613 children lived in Rhode Island in 2021.³ The 2022 Kids Count reports several statistics that are relevant to child support.⁴

- The percentage of Rhode Island children living in poverty is 16%, while it is 17% nationally.⁵
- The percentage of children whose parents lack secure employment is 28% in Rhode Island and 27% nationally.
- The percentage of children living in single-parent families is 37% both in Rhode Island and nationally.
- The percentage of Rhode Island female-headed families receiving child support is 24%, while it is 26% nationally.⁶

Still, many Rhode Island families benefit from child support. In federal fiscal year (FFY) 2021, the state child support agency, which is called the Office of Child Support Services (OCSS) and is under the Rhode Island Department of Human Services (DHS), served 50,002 cases.⁷ In FFY 2021, OCSS established 1,217 support orders,⁸ collected and distributed almost \$77 million in child support, and received 62.4 percent of the current support due. Other than certain types of public assistance cases, use of OCSS services is

³ U.S. Census American Community Survey 2019. Retrieved from <https://data.census.gov>.

⁴ Most of the statistics are averaged across 2016–2020. Annie E. Casey Foundation. (2022). *2022 Kids Count Data Book: State Trends in Child Well-Being*. Retrieved from <https://assets.aecf.org/m/resourcedoc/aecf-2021kidscountdatabook-2022.pdf>.

⁵ This is from 2020 data rather than 2019.

⁶ For this particular data field, the data is actually from 2018–2020. Retrieved from <https://datacenter.kidscount.org/data/tables/10453-female-headed-families-receiving-child-support?loc=52&loct=2#detailed/2/41,52/false/1985,1757,1687/any/20156,20157>.

⁸ Five years ago, CSS established over 30,000 orders per year. It is believed that the count is down due to the pandemic and other factors.

not mandated. The number of child support cases that are not part of OCSS and the collections on those cases are unknown. Child support collected on non-OCSS cases, however, is likely to exceed OCSS collections.⁹

Although state data are not available, a 2015 national study found that without child support, the child poverty rate would be 7.0 percentage points higher.¹⁰ Nonetheless, other national research finds that almost a quarter of nonresidential parents have no or limited reported earnings.¹¹ These statistics underscore the delicate balance at low incomes where child support can help lift families out of poverty, but must recognize that low-income parents who are not living with the child may have a limited ability to pay. In short, this is the reason that the Rhode Island child support guidelines include a self-support reserve for the payer-parent.

FEDERAL REQUIREMENTS

Federal regulation (45 C.F.R. § 302.56(e)) requires states to review their guidelines at least once every four years. As shown in Exhibit 2, federal regulation imposes many other requirements of state child support guidelines and state guidelines review processes. Federal regulation expanded state requirements in 2016 through the Flexibility, Efficiency, and Modernization in Child Support Enforcement Programs rule.¹² The deadline for meeting these federal requirements depends on a state's guidelines review cycle. It typically spans two review cycles and longer for some states that were granted a pandemic-based extension from the federal Office of Child Support Enforcement. For example, some states have until 2025 to meet the federal requirements. The 2018 Rhode Island review addressed the expanded federal requirements of state guidelines—namely, the two major changes: the federal requirement (45 C.F.R. § 302.56(c)(1)(iii)) to consider the actual circumstances of the obligated parent when income imputation is authorized, and the federal requirement (45 C.F.R. § 302.56(c)(3)) to not treat incarceration as voluntary employment. The current Rhode Island guidelines meet both requirements.

OCSS also collected and analyzed case file data to meet federal data requirements (45 C.F.R. § 302.56(h)) of state guidelines reviews. The data consisted of an extract of 15,350 orders in which the Family Court established, suspended, or otherwise modified an order for financial child support or medical support anytime between September 18, 2017, and December 31, 2021. The analysis of the sample found a 1.6% deviation rate and that income was imputed to at least one party among 10.2% of sampled orders. Most (76%) of the cases where income was imputed involved a public assistance case. Payments were analyzed over the same period. Full and timely monthly payments were uncommon

⁹ The author suggests this based on data from various sources that nongovernment child support cases tend to have higher orders and higher payments data.

among orders with income imputation: only 25% had full and timely monthly payments. In contrast, 48% of those without a guidelines deviation or income imputation paid in full and timely over the same period.

Rhode Island's deviation and income imputation rates (1.6% and 10.2%, respectively) are considerably below those of states in which data are available. Of Northeast states and mid-Atlantic states with published deviation rates, Maryland has the highest deviation rate at 35%, and Maine has the lowest, with just 5% among IV-D orders and 16% among non-IV-D orders.^{13,14} Massachusetts' deviation rate (which included deviations, income imputation, or default) was just 11%, and Pennsylvania's was 25%.^{15,16} Delaware's 2018 report showed a deviation rate of 22%.¹⁷ Connecticut, Vermont, and New York do not publish their deviation rates. The income imputation rates of these states were 23% among Maryland payer-parents and 17% among Maryland receiving parents; 24% of Maine payer-parents with IV-D court orders, 11% among Maine payer-parents with non-IV-D orders, 18% among Maine custodians with IV-D court orders, and 13% among Maine custodians with non-IV-D court orders; 11% of Pennsylvania payer-parents and 12% among Pennsylvania custodians; and 31% among Delaware payer-parents.

ORGANIZATION OF REPORT

Section 2 reviews the economic data on the cost of raising children and uses it to develop an updated schedule. It also lists the steps and economic data used to develop an updated child support schedule.

Section 3 analyzes the impact of the existing and updated schedule using case scenarios.

Section 4 provides conclusions.

Appendix A provides details technical documentation of the data and steps used to develop the updated schedule.

Appendix B provides updated schedule.

Appendix C provides the gross-to-net income conversion table.

Appendix D provides a side-by-side comparison of the updated schedules to the existing schedule.

Exhibit 2: Federal Regulations Pertaining to State Child Support Guidelines

45 C.F.R. § 302.56 Guidelines for setting child support orders

- (a) Within 1 year after completion of the State's next quadrennial review of its child support guidelines, that commences more than 1 year after publication of the final rule, in accordance with § 302.56(e), as a condition of approval of its State plan, the State must establish one set of child support guidelines by law or by judicial or administrative action for setting and modifying child support order amounts within the State that meet the requirements in this section.
- (b) The State must have procedures for making the guidelines available to all persons in the State.
- (c) The child support guidelines established under paragraph (a) of this section must at a minimum:
 - (1) Provide that the child support order is based on the noncustodial parent's earnings, income, and other evidence of ability to pay that:
 - (i) Takes into consideration all earnings and income of the noncustodial parent (and at the State's discretion, the custodial parent);
 - (ii) Takes into consideration the basic subsistence needs of the noncustodial parent (and at the State's discretion, the custodial parent and children) who has a limited ability to pay by incorporating a low-income adjustment, such as a self-support reserve or some other method determined by the State; and
 - (iii) If imputation of income is authorized, takes into consideration the specific circumstances of the noncustodial parent (and at the State's discretion, the custodial parent) to the extent known, including such factors as the noncustodial parent's assets, residence, employment and earnings history, job skills, educational attainment, literacy, age, health, criminal record and other employment barriers, and record of seeking work, as well as the local job market, the availability of employers willing to hire the noncustodial parent, prevailing earnings level in the local community, and other relevant background factors in the case.
 - (2) Address how the parents will provide for the child's health care needs through private or public health care coverage and/or through cash medical support;
 - (3) Provide that incarceration may not be treated as voluntary unemployment in establishing or modifying support orders; and
 - (4) Be based on specific descriptive and numeric criteria and result in a computation of the child support obligation.
- (d) The State must include a copy of the child support guidelines in its State plan.
- (e) The State must review, and revise, if appropriate, the child support guidelines established under paragraph (a) of this section at least once every four years to ensure that their application results in the determination of appropriate child support order amounts. The State shall publish on the internet and make accessible to the public all reports of the guidelines reviewing body, the membership of the reviewing body, the effective date of the guidelines, and the date of the next quadrennial review.
- (f) The State must provide that there will be a rebuttable presumption, in any judicial or administrative proceeding for the establishment and modification of a child support order, that the amount of the order which would result from the application of the child support guidelines established under paragraph (a) of this section is the correct amount of child support to be ordered.
- (g) A written finding or specific finding on the record of a judicial or administrative proceeding for the establishment or modification of a child support order that the application of the child support guidelines established under paragraph (a) of this section would be unjust or inappropriate in a particular case will be sufficient to rebut the presumption in that case, as determined under criteria established by the State. Such criteria must take into consideration the best interests of the child. Findings that rebut the child support guidelines shall state the amount of support that would have been required under the guidelines and include a justification of why the order varies from the guidelines.
- (h) As part of the review of a State's child support guidelines required under paragraph (e) of this section, a State must:
 - (1) Consider economic data on the cost of raising children, labor market data (such as unemployment rates, employment rates, hours worked, and earnings) by occupation and skill-level for the State and local job markets, the impact of guidelines policies and amounts on custodial and noncustodial parents who have family incomes below 200 percent of the Federal poverty level, and factors that influence employment rates among noncustodial parents and compliance with child support orders;
 - (2) Analyze case data, gathered through sampling or other methods, on the application of and deviations from the child support guidelines, as well as the rates of default and imputed child support orders and orders determined using the low-income adjustment required under paragraph (c)(1)(ii) of this section. The analysis must also include a comparison of payments on child support orders by case characteristics, including whether the order was entered by default, based on imputed income, or determined using the low-income adjustment required under paragraph (c)(1)(ii). The analysis of the data must be used in the State's review of the child support guidelines to ensure that deviations from the guidelines are limited and guideline amounts are appropriate based on criteria established by the State under paragraph (g); and
 - (3) Provide a meaningful opportunity for public input, including input from low-income custodial and noncustodial parents and their representatives. The State must also obtain the views and advice of the State child support agency funded under title IV-D of the Act.

SECTION 2: COST OF RAISING CHILDREN AND SCHEDULE UPDATE

Child support schedules and formulas are part policy and part economic data. Most state guidelines rely on a study of child-rearing expenditures as the underlying basis of their child support schedule or formula. Federal regulation (45 C.F.R. § 302.56(h)(1)) requires states to consider economic data on the cost of raising children as part of a state’s child support guidelines review. The existing Rhode Island schedule relies on a 2010 study of child-rearing expenditures from families surveyed in 2004–2009 conducted by Professor David Betson using the Rothbarth methodology to separate the child’s share of expenditures from total household expenditures.¹⁸ The study results were updated and adjusted to consider 2017 price levels; 2017 federal and state income taxes and FICA (which affect the amount of after-tax income available to spend); an adjustment for Rhode Island’s housing cost; and the 2017 federal poverty guidelines for one person, which is used as a self-support reserve. The adjustment for Rhode Island’s housing cost was to reflect the difference between Rhode Island’s housing cost and the national average because the BR measurements consider national data.

This section documents more current economic studies on the cost of raising children and uses a more current study of BR child-rearing expenditures to update the Rhode Island child support schedule. It also documents the major data sources, assumptions, and steps used to develop the updated schedules. Alternative updated schedules were developed using different data and assumptions about the difference between Rhode Island and national housing costs. At the time of the Task Force’s deliberation that began in early 2022, the economy was still experiencing major changes stemming directly and indirectly from the COVID-19 pandemic that began early 2020. This included major changes in housing prices partially due to the out migration of populations from densely populated areas to less populated areas. Unfortunately, due to lags in data collection and analysis, current data on the difference between Rhode Island and national housing costs is lacking. To overcome this obstacles, several alternative data sources on housing costs were examined; and the impact of using the alternatives were examined.

KEY ASSUMPTIONS OF UPDATED SCHEDULE

The key economic data and assumptions underlying the updated schedule are summarized below. Each is discussed in more detail in the next section.

- There are no significant changes in the underlying policy principles and guidelines model—that is, the Rhode Island guidelines relies and continues to rely on the income shares model.
- The updated schedules are based on the 2021 Betson-Rothbarth (BR) measurements of child-rearing expenditures estimated from families participating in the 2013–2019 Consumer Expenditure (CE) survey.¹⁹ Professor Betson is the economist who developed the measurements using the

¹⁸ Betson, David M. (2010). “Appendix A: Parental Expenditures on Children.” *In* Judicial Council of California, Review of Statewide Uniform Child Support Guideline. San Francisco, CA. Retrieved from <http://www.courts.ca.gov/partners/documents/2011SRL6aGuidelineReview.pdf>.

¹⁹ Betson, David M. (2021). “Appendix A: Parental Expenditures on Children: Rothbarth Estimates.” *In* Venohr, Jane, & Matyasic, Savahanna. (Feb. 23, 2021). Review of the Arizona Child Support Guidelines: Findings from the Analysis of Case File Data and

“Rothbarth” methodology to separate the child’s share of expenditures from total household expenditures. The current Rhode Island schedule is based on an earlier BR study.

- For the purposes of developing a schedule, the BR measurements are updated to August 2022 price levels.
- The BR measurements are adjusted for Rhode Island’s price parity, which is a measure of how much a state or region’s prices are above or below the national average. Price parity considers differences in housing cost and the cost of other economic goods and services. Rhode Island has above average prices.
- The schedule does not include childcare expenses; the cost of the child’s health insurance premium; and the extraordinary, unreimbursed medical expenses of the child. The guidelines consider the actual amounts expended for these items on a case-by-case basis. The schedule includes ordinary, out-of-pocket medical expenses of \$250 per child per year. Even healthy children are likely to incur some medical expenses over the course of the year, such as children’s medicine, cough syrup, or copays.
- The BR measurements of child-rearing expenditures are expressed as a percentage of total family expenditures and are converted to gross income for guidelines purposes. The conversion considers federal and state income tax rates and FICA in 2022.
- The schedule is based on the average of all expenditures on children from ages 0 through 17 years. There is no adjustment for the child’s age.
- The schedule incorporates a self-support reserve for low-income obligors based on the 2022 federal poverty guidelines for one person (\$1,133 per month).

OVERVIEW OF ECONOMIC STUDIES

Several different methodologies are used to estimate the cost of raising children. A methodology is necessary because the cost of raising children must be separated from other expenditures in the household, particularly since many items (e.g., a loaf a bread, electricity for the house) may be consumed by all residents in the household, not just by the children. Further, there are two major types of studies on the economic cost of children: the cost of providing the basic or minimum needs of households with children,²⁰ and studies that try to estimate what families across a range of incomes

Updating the Child Support Schedule. Report to the Arizona Supreme Court Administrative Office of the Courts. Retrieved from <https://www.azcourts.gov/Portals/74/FCIC-CSGR/SupplementalPacket-030121-FCIC-CSGRS.pdf?ver=2021-02-26-161844-187>.

²⁰ Several different economic indicators are used to gauge basic (minimum needs). Even the federal poverty guidelines (FPG) is used. The 2022 federal poverty guidelines for one person is \$1,133 per month; each additional person in the household is \$393 per month (U.S. Health and Human Services Office of the Assistant Secretary for Planning and Evaluation (Jan. 12, 2022)). HHS Poverty guidelines for 2022. <https://aspe.hhs.gov/topics/poverty-economic-mobility/poverty-guidelines>. Other commonly used economic indicators is the “living wage” or the “self-sufficiency standard.” More information about the Rhode Island living wage can be found at Massachusetts Institute of Technology. (n.d.). Living Wage Calculation for Rhode Island. Retrieved from <https://livingwage.mit.edu/states/37>. The Rhode Island self-sufficiency standard was last published in 2020. Pearce, Diane. (Feb. 2020). *The Self-Sufficiency Standard for Rhode Island 2020*. Retrieved from https://www.unitedwaync.org/sites/unitedwaync.org/files/NC2020_SSS%20FINAL_0.pdf.

(including middle- and higher-income families) actually spend on children. Most state guidelines, including the Rhode Island guidelines, rely on studies estimating child-rearing expenditures for a range of incomes. This is because the premise of most state guidelines is that children should share in the lifestyle afforded by their parents—that is, if the obligated parent’s income affords the obligated parent a higher standard of living, the support order should also be more for that higher-income parent. Basing a child support schedule or formula on the cost of the basic needs of the child would be inadequate for figuring out what an obligated parent who can afford a lifestyle above subsistence can afford in child support.

Overview of Betson-Rothbarth Measurements

There are several methodologies for estimating how much families actually spend on child. Most measurements of child-rearing expenditures underlying state child support guidelines, including the Rhode Island guidelines schedule, are estimated using the Rothbarth methodology. Rhode Island, 30 other states, the District of Columbia, and Guam base their child support guidelines on a Rothbarth estimator of child-rearing expenditures. The Rothbarth methodology compares expenditures between equally well-off families with and without children and attributes the difference to child-rearing expenditures. The first Rothbarth estimate of child-rearing expenditures used for state guidelines was from a 1990 study by Professor David Betson, University of Notre Dame.²¹ He used the Rothbarth methodology to estimate child-rearing expenditures from data collected from families in 1980–1986. Since 1990, Betson has updated his study for more current expenditures data four times. His most recent study was funded by the State of Arizona, published in 2021, and considers expenditures data from 2013–2019.²² It found that on average, families devote the following percentage of total expenditures to child-rearing expenditures:

- 24.9% for one child;
- 38.4% for two children; and
- 47.0% for three children.

The 2021 Betson-Rothbarth (BR) measurements are used to develop an updated child support schedule for Rhode Island. As discussed later, there are several steps and additional data used to convert the 2021 BR measurements to a child support schedule. More detail on this and some nuanced differences on how the 2021 BR measurements differ from those used to develop the existing schedule are provided in the next subsection.

The 2021 Betson study is the most current study of child-rearing expenditures. It has been recently used to update the child support schedules of Alabama, Arizona, Iowa, Missouri, Pennsylvania, and South Dakota. Several other states are proposing schedule or formula updates based on the 2021 BR study:

²¹ Betson, David M. (1990). *Alternative Estimates of the Cost of Children from the 1980–86 Consumer Expenditure Survey*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. University of Wisconsin Institute for Research on Poverty, Madison, WI.

(Feb. 23, 2021). *Review of the Arizona Child Support Guidelines: Findings from the Analysis of Case File Data and Updating the Child Support Schedule*. Report to the Arizona Supreme Court Administrative Office of the Courts. Retrieved from <https://www.azcourts.gov/Portals/74/FCIC-CSGR/SupplementalPacket-030121-FCIC-CSGRS.pdf?ver=2021-02-26-161844-187>.

Illinois, Maine, Mississippi, South Carolina, and West Virginia. In fact, all states that have recently updated their child support schedule have relied on the 2021 Betson-Rothbarth (BR) measurements as the basis of their update. The only exception is Massachusetts, where its task force considered the 2021 BR study, but also considered “a range of legal, policy and practical considerations” when recommending changes to its chart²³ that were eventually adapted. In other words, the Massachusetts schedule does not strictly relate to economic data.

USDA Study

The USDA first measures expenditures for seven different categories (i.e., housing, food, transportation, clothing, healthcare, childcare and education, and miscellaneous) and then sums them to arrive at a total measurement of child-rearing expenditures. Some of the methodologies use a pro rata approach, which is believed to overstate child-rearing expenditures. The USDA reports its estimates on an annual basis for one child in a two-child household. The USDA provides measurements for the United States as a whole and as four regions: the South, Midwest, Mid-Atlantic, and West. The USDA also produces measurements for rural areas and single-parent families. These measurements are for the nation as whole and not provided individually by region.

The USDA amounts also vary by age of the child and household income. The most recent USDA measurements are from expenditures data collected in 2011 through 2015. They are shown in Exhibit 3. This is the amount for one child in two-child households. If there is only one child in the household, the USDA found the amounts, as shown in Exhibit 3, should be increased by 27%. If there are three or more children in the household, the amounts should be adjusted by the number of children multiplied by 76%. (These adjustments for less and more children were incorporated into the existing schedule.) The amounts include expenditures for the child’s healthcare and childcare expenses.

Exhibit 3: Summary of Findings from 2017 USDA Study

		Married-Couple Families		Single-Parent Families (overall US)
		Urban (overall U.S.)	Rural Areas (overall U.S.)	
Low Income (less than \$59,200 gross per year)	Child-rearing \$	\$9,330–\$9,980/year	\$7,650–\$8,630/year	\$8,800–\$10,540/year
	Average Gross Income	\$36,300	\$36,100	\$24,400
Middle Income (more than \$59,200 per year and less than \$107,400 for Urban and Rural Only)	Child-rearing \$	\$12,350–\$13,900/year	\$10,090–\$11,590/year	\$16,370–\$20,190/year
	Average Gross Income	\$81,700	\$79,500	\$99,000
High Income (more than \$107,400 for Urban and Rural only)	Child-rearing \$	\$19,380–\$23,380/year	\$14,600–\$17,000/year	
	Average Gross Income	\$185,400	\$156,800

Retrieved from <https://www.mass.gov/doc/economic-review-of-the-massachusetts-child-support-guidelines-2020-2021/download>.

One salient finding (as shown in Exhibit 3) that is pertinent to addressing concerns about using expenditures data from intact families as the basis of state child support guidelines is that single-parent families with low income and married-couple families with low income devote about the same amount to child-rearing expenditures. It should also be noted that the amounts for middle and high incomes for single-parent families are not separated because there are too few high-income, single-parent families from which to produce measurements. More single-parent families with children live in poverty than married-couple families with children. The 2021 U.S. Census finds that 17% of Rhode Island female-headed families with minor children live in poverty, while less than 1% of Rhode Island married-couple families with minor children live in poverty.²⁴

As shown below, the USDA amounts are generally more than the BR amounts.

Exhibit 4: Comparison of Economic Estimates of Child-Rearing Expenditures

Economic Methodology	Economist and Data Years	Average Child-Rearing Expenditures as a Percentage of Total Expenditures		
		1 Child	2 Children	3 Children
Rothbarth	Betson/Rothbarth (BR)			
	2013–2019	24.9%	38.4%	47.0%
	2004–2009	23.5%	36.5%	44.9%
	1998–2004	25.2%	36.8%	43.8%
	1996–1998	25.6%	35.9%	41.6%
	1980–1986	24.2%	34.2%	39.2%
	Rodgers/Replication of Betson²⁵			
	2004–2009 CE	22.2%	34.8%	43.2%
	Rodgers²⁶			
	2000–2015 CE	19.2%	24.1%	30.8%
2004–2009 CE	21.5%	24.4%	33.4%	
2000–2011	21.0%	25.0%	31.0%	
Florida State University²⁷				
2009–2015 CE	24.9%	38.3%	46.9%	
USDA	USDA²⁸			
	2011–2015 CE	26.0%	39.0%	49.0%

The USDA study partially forms the basis of the Minnesota child support guidelines and the Maryland schedule amounts at upper incomes. The USDA study does not form the basis of any other state’s guidelines besides Maryland and Minnesota.

Overview of Other Measurements of Child-Rearing Expenditures

Besides the Rothbarth and USDA methodology, there are several other economic methodologies used to separate the child’s share of expenditures from total household expenditures. Betson assessed four other alternatives, including the USDA methodology, in his 1990 study. He concluded that the Rothbarth methodology produced the most statistically robust estimates and recommended for use in state guidelines. At the time, the USDA used a different methodology to estimate the child’s share of housing costs: specifically, a per-capita approach (e.g., if there are two parents and one child in the same household and the household spent \$1,200 per month on housing then the cost of housing would be \$400 per month for the one child since the child’s prorated share is 33%—that is, one child divided by the three people in the household). Many economists believe that the per-capita methodology overstates the child’s share of housing costs.²⁹ To that end, the USDA revised its approach to measuring the child’s share of housing expenses. This revised approach is used in the 2017 USDA study.

In general, economists do not agree which methodology comes the closest to measuring actual child-rearing expenditures. Most conventional economists, including Betson, believe that the Rothbarth methodology understates actual child-rearing expenditures.³⁰ Many other studies based on alternative methodologies, however, use older data or are not used by any state as the basis of their guidelines.

Three studies that are frequently mentioned in state guidelines reviews are a 2017 study conducted for California applying the Rothbarth methodology to expenditures data collected in 2000–2015,³¹ a 2016 study by Professor Emeritus William Comanor, University of California at Santa Barbara,³² and a 2021 Florida State University study that used expenditures data collected in 2013–2019.³³ None of these studies form the basis of any state’s guidelines. The 2018 Comanor study is criticized for yielding amounts near poverty for all income ranges. It is not used by any state.

The Florida researchers used both the Rothbarth approach and another marginal cost approach developed by Ernest Engel and applied both methodologies to 2013–2019 expenditures data, which is

²⁹ For example, Betson, David M. (2021). “Appendix B: Additional Research on the Cost of Raising Children” *In* Judicial Council of California, *Review of Statewide Uniform Child Support Guideline*. the same data years of the most current BR study. The difference between the Rothbarth estimator and the Engel estimator is how they equate equally well-off families. The Rothbarth estimator uses expenditures on adult goods (e.g., expenditures on adult clothing as a proxy), and the Engel estimator uses expenditures on food shares. Most conventional economists believe neither approach perfectly measures actual child-rearing expenditures because of substitution effects.³⁴ The mathematical underpinnings of the economic theory underlying the Rothbarth methodology suggests the Rothbarth methodology understates actual child-rearing expenditures. Only a few states still rely on Engel estimates. Most states that previously used Engel estimates have switched to Rothbarth estimates. The Florida researchers reported their estimates as a percentage of consumption (total household expenditures) for five quintiles of income. Using the Rothbarth methodology, they ranged from 21.0 to 21.5% for one child, 32.9 to 33.7% for two children, and 40.8 to 41.7% for three children.

In addition to these three studies, an approach similar to the USDA approach was attempted for California's 2021 review.³⁵ The study found that the USDA methodology was not sufficiently documented to replicate it, particularly the methodologies and data sources to arrive at the cost of the child's housing expenses and medical expenses. Further, the study found that the results were highly sensitive to the assumptions about housing costs.

UNDERLYING DATA AND ASSUMPTIONS USED TO DEVELOP UPDATED SCHEDULE

Besides the economic basis of an updated schedule, there are many other factors considered in the development of a child support schedule:

1. The guidelines model is a policy decision that directs what type of economic study of child-rearing expenditures to use;
2. Which particular economic study to use;
3. Adjust the study results for current price levels since there are lags between when expenditures data are collected and analyzed and available for use;
4. Adjust the national data for below/above average prices or state cost of living such as housing cost;
5. Exclude childcare; the child's health insurance premium; and extraordinary, out-of-pocket medical expenses since the actual amounts on these items are considered on a case-by-case basis;
6. Consider expenditures to net income ratio, which is the first step to converting the BR measurements, that are measured as a percentage of total household expenditures, to gross-income basis;
7. Consider current rates of federal and state income taxes and FICA, which is the second step to converting BR measurements to gross income basis; and
8. Incorporate a self-support reserve into the schedule.

³⁴ For example, see Lewin/ICF. (1990). *Estimates of Expenditures on Children and Child Support Guidelines*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. Fairfax, VA.

San Francisco, CA. Retrieved from <https://www.courts.ca.gov/documents/Review-of-Uniform-Child-Support-Guideline-2021.pdf>.

Appendix A provides more detailed technical documentation of how the schedule is updated using these factors. Exhibit 5 compares the key economic data and assumptions underlying the existing schedule to those of alternative updates that were considered by the Task Force in January 2022. Each factor is discussed in more detail following the table.

Factor 1: Guidelines Model

The guidelines model, which is a policy decision, is important to directing what economic data on the cost of raising children to use. The most common principle used for state guidelines models is what University of Wisconsin researchers call the “continuity of expenditures model”—that is, the child support award should allow the children to benefit from the same level of expenditures had the children and both parents lived together.³⁶ In the income shares guidelines model—which is used by 41 states, including Rhode Island—the payer-parent’s prorated share of that amount forms the basis of the guidelines-determined amount. Most states that use the percentage-of-obligor income guidelines model use the same economic studies but presume that the custodial parent contributes an equal dollar amount or percentage of income to child-rearing expenditures. Seven states use the percentage model.

Delaware, Hawaii, and Montana use the Melson formula, which is a hybrid of the income shares approach and the percentage-of-obligor income guidelines. Each of these states prorates a basic level of support to meet the primary needs of the child; then, if the payer-parent has any income remaining after meeting their share of the child’s primary support, their own basic needs, and payroll taxes, an additional percentage of their income is added to their share of the child’s primary support.

Research finds that other factors (e.g., economic basis, updates for changes in price levels over time, and adjustments for low-income parents) affect state differences in guidelines amounts more than the guidelines model.³⁷ All states that have switched guidelines models in the last two decades have switched to the income shares model (i.e., Arkansas, District of Columbia, Georgia, Illinois, Massachusetts, Minnesota, and Tennessee). A common reason for switching to the income shares model is its perception of equity. Besides the guidelines models in use, there are several other guidelines models not in use that have been proposed in several states.³⁸ Each have failed for various reasons. In general, there is no overwhelming reason for Rhode Island to consider switching guidelines models.

Exhibit 5: Summary of Economic Data and Assumptions Underlying Rhode Island’s Current Child Support Schedule and Alternative Updates as of January 2022

Factor	Basis of Existing	Update A (use RI price parity)	Update A.1 (use RI price parity with no decreases below SSR)	Update B (housing adjustment)	Update C (old method above \$5,500)
1. Guidelines model	Income Shares (used by 41 states)	Income Shares	Income Shares	Income Shares	Income Shares
2. Study of child-rearing expenditures	4th Betson-Rothbarth study (BR4) from expenditure data collected in 2004–2009	BR5 (2013–2019 expenditure data)	BR5	BR5	BR5
3. Price levels	Jan. 2017 price levels	Jan. 2022 (16.5% increase in prices)	Jan. 2022 (later updated to Aug. 2022 price levels)	Jan. 2022	Jan. 2022
4. Adjustments for RI housing costs/prices	<ul style="list-style-type: none"> Adjusted bottom (below about \$6,000) for RI rents in 2017 Adjusted top in 2012 for above-average housing 	RI Price Parity 2020 (101.8)	RI price parity	Alternative housing adjustment	Previous method
5. Spending more/less of after-tax Income	Use actual ratios with cap	No change	No change	No change	No change
6. Highly variable child-rearing expenses excluded from schedule	Childcare and most healthcare costs are not in schedule, schedule includes \$250 per child per year for ordinary and routine medical expenses (e.g., over-the-counter medicines)	No change	No change	No change	No change
7. Adjust for federal and state taxes	2017 federal and state income tax withholding formula for single tax filer	2022 formulas	2022 formula	2022 formulas	2022 formulas
8. Low-income adjustment and minimum order	Self-support reserve of \$1,007 (2017 federal poverty guidelines for one person) with minimum order of \$50/month	\$1,133 (2022 FPG) with \$50 minimum order	\$1,133 (2022 FPG) with \$50 minimum order	\$1,133 (2022 FPG) with \$50 minimum order	\$1,133 (2022 FPG) with \$50 minimum

Factor 2: Economic Study

There are several measurements of child-rearing expenditures that form the basis of state guidelines. The newest Betson-Rothbarth (BR5) clearly emerges as the most appropriate study to update the Rhode Island schedule that is based on an older BR study. Its underlying data is more current than that of any other study besides the Florida study that is not used by any state. It also uses the same methodology and assumptions as the basis of the existing schedule, which is an earlier Betson-Rothbarth (BR) study. Most states rely on a BR study.

Betson-Rothbarth Studies

Historical Overview

When Congress first passed legislation (i.e., the Family Support Act of 1988) requiring presumptive state child support guidelines, it also mandated the U.S. Department of Health and Human Services to develop a report analyzing expenditures on children and explain how the analysis could be used to help states develop child support guidelines. This was fulfilled by two reports that were both released in 1990. One was by Professor David Betson, University of Notre Dame.³⁹ Using five different economic methodologies to measure child-rearing expenditures, Betson concluded that the Rothbarth methodology was the most robust⁴⁰ and, hence, recommended that it be used for state guidelines. The second study resulting from the congressional mandate was by Lewin/ICF.⁴¹ It assessed the use of measurements of child-rearing expenditures, including the Betson measurements, for use by state child support guidelines.

The Rothbarth methodology is named after the economist, Irwin Rothbarth, who developed it. It is considered a marginal cost approach—that is, it considers how much more is spent by a couple with children than a childless couple of child-rearing age. To that end, the methodology compares expenditures of two sets of equally well-off families: one with children and one without children. The difference in expenditures between the two sets is deemed to be child-rearing expenditures. The Rothbarth methodology relies on expenditures for adult goods to determine equally well-off families.⁴² Through calculus, economists have proven that using expenditures on adult goods understates actual child-rearing expenditures because parents essentially substitute away from adult goods when they have children.⁴³ In contrast, the Engel methodology is also a marginal cost approach but relies on food shares to determine equally well-off families. Historically, it overstated actual child-rearing

³⁹ Betson, David M. (1990). *Alternative Estimates of the Cost of Children from the 1980–86 Consumer Expenditure Survey*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. University of Wisconsin Institute for Research on Poverty, Madison, Wisconsin.

⁴⁰ In statistics, the term “robust” means the statistics yield good performance that are largely unaffected by outliers or sensitive to small changes to the assumptions.

⁴¹ Lewin/ICF. (1990). *Estimates of Expenditures on Children and Child Support Guidelines*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. Fairfax, VA.

⁴² Specifically, Betson uses adult clothes, whereas others applying the Rothbarth estimator use adult clothing, alcohol, and tobacco regardless of whether expenditures are made on these items. Betson (1990) conducted sensitivity analysis and found little difference in using the alternative definitions of adult goods.

⁴³ A layperson’s description of how the Rothbarth estimator understates actual child-rearing expenditures is also provided in Lewin/ICF (1990) on p. 2-29.

expenditures because children are relatively food intensive.⁴⁴ Recent Engel estimates, however, are less than the Rothbarth estimates. The validity of the new Engel estimates is questionable due to its sensitivity to alternative sample specification and a change in how food is measured in the CE that appears to affect that sensitivity.

At the time of Betson's 1990 study, most states had already adopted guidelines to meet the 1987 federal requirement to have advisory child support guidelines. (The requirement was extended to be rebuttal presumptive guidelines in 1989.) Most states were using older measurements of child-rearing expenditures,⁴⁵ but many began using the Betson-Rothbarth 1990 (BR1) study in the mid- to late 1990s. Subsequently, various states and the University of Wisconsin Institute of Research commissioned updates to the BR study over time.⁴⁶

Although Betson recommended the Rothbarth methodology for state guidelines usage in his 1990 report, another study commissioned by the U.S. Department of Health and Human Services in 1990 by Lewin/ICF suggested that states assess their guidelines using more than one study since not all economists agree on which methodology best measures actual child-rearing expenditures.⁴⁷ For its 1990 report, Lewin/ICF assessed state guidelines by generally examining whether a state's guidelines amount was between the lowest and the highest of credible measurements of child-rearing expenditures. Lewin/ICF used the Rothbarth measurements as the lower bound. Amounts that were above the lowest credible measurement of child-rearing expenditures were deemed as adequate support for children. This also responded to a major concern in the 1980s that state child support guidelines provided inadequate amounts for children.⁴⁸ Since then, most states have adapted a BR measurement as the basis of their guidelines schedule or formula.

Most Current BR Measurements and the COVID-19 Pandemic

The most current BR measurements consider expenditure data from 2013–2019, which is before the COVID-19 pandemic began in 2020. The pandemic impacts the economy and expenditures in many ways. The ideal would be to have more current measurements of child-rearing expenditures, but there are several problems with that. One is that the economy and consumption are still changing. Another concerns the underlying data source, the Consumer Expenditure (CE) survey. The CE response rate in 2020, the year the pandemic began, declined.⁴⁹ The impact of this decline on survey results is still being assessed.

⁴⁴ A layperson's description of how the Engel estimator overstates actual child-rearing expenditures is also provided in Lewin/ICF (1990) on p. 2-28. Lewin/ICF. (1990). *Estimates of Expenditures on Children and Child Support Guidelines*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. Fairfax, VA.

Overall consumer spending decreased 9.8% from the second quarter of 2019 to second quarter of 2020 (when the pandemic began).⁵⁰ Then, the next year (i.e., second quarter of 2020 to second quarter of 2021), consumer expenditures increased by 15.7%. Using basic economic theory, almost every factor known to affect supply and demand level has changed since the pandemic began. At the microeconomic level (which considers individual goods and services), these factors include changes in price levels, income (including changes caused by government stimulus payments and the temporary increase in the child tax credit),⁵¹ prices of related goods and services, and taste and preferences (e.g., increased demand for at-home entertainment at the beginning of the pandemic); consumers' expectations about the future; the number of buyers; changes in input prices (e.g., availability of semi-conductor chips) and technology (e.g., technology that affects ability to work remotely); suppliers' expectations about the future prices; and the number of sellers.

An example of change in taste and preferences is observed by changes in consumption from the beginning of the pandemic (2020) to when most people became vaccinated and new viral strains were less likely to require hospitalizations (2021–2022) to now. Consumer spending declined for several expenditure categories in 2020 when the pandemic began. At the end of the second quarter of 2020 and over the past year, consumption of food away from home declined by 54%, apparel and services declined by 49%, entertainment declined by 21%, and transportation declined by 19%.⁵² In the following year (the second quarter of 2020 to the second quarter of 2021), several of these categories rebounded: consumption of food away from home rose 91%, apparel and services rose 70%, entertainment rose 28%, and transportation rose 23%.

The changes extend to the macroeconomic model of aggregate demand and aggregate supply that affects overall price levels (in other words, inflation) and the economy's total output of goods and services. The aggregate demand/supply model is affected by interest rates (which are affected by the Federal Reserve's policies) and changes in consumer demand, investment, government purchases (which increased due to stimulus bills), net export (e.g., changes in overseas shipping affected net exports), labor (where labor generally declined as evidenced by the reduction of labor force participation), capital stock, natural resources (e.g., reduction in oil drilling), and technological knowledge. In general, several of these factors contribute to increased demand, while few of these factors suggest that supply is increasing to offset the pressure that increased demand imposes on prices.

The result is increased price levels—that is, inflation. From March 2020 through October 2022, prices increased by 15.5%.⁵³ In the last year, prices have increased 7.7% alone. Price changes have not been uniform across all goods and services. For example, although the all-items price index increased 7.7 % in

⁵⁰ U.S. Bureau of Labor Statistics. (May 2022). "Changes to Consumer Expenditures during the Covid-19 Pandemic." *TED: The Economic Daily*. Retrieved from <https://www.bls.gov/opub/ted/2022/changes-to-consumer-expenditures-during-the-covid-19-pandemic.htm>.

⁵¹ Both the Coronavirus Aid, Relief and Economic Security Act (CARES Act) of 2020 and the American Rescue Plan Act of 2021 affected consumer income.

⁵² U.S. Bureau of Labor Statistics. (May 3, 2022). "Changes to Consumer Expenditures during the Covid-19 Pandemic." *TED: The Economics Daily*. Retrieved from <https://www.bls.gov/opub/ted/2022/changes-to-consumer-expenditures-during-the-covid-19-pandemic.htm>.

⁵³ Calculated from the U.S. Bureau of Labor Statistics. (n.d). *Consumer Price Index Historical Tables for U.S. City Average*. Retrieved from https://www.bls.gov/regions/mid-atlantic/data/consumerpriceindexhistorical_us_table.htm.

the last year, the food price index increased 10.9% and the energy price index rose 17.6% over the same period.⁵⁴ In all, price increases generally suggest increases to the schedule are warranted. There are some possible exceptions due to substitution effects. For example, increases to the cost of childcare may cause families to cut back on other child-rearing expenditures. If enough families cut back on other child-rearing expenditures, this could indirectly suggest schedule decreases. This is because the schedule does not consider childcare expenses (rather, the actual cost of childcare is considered on a case-by-case basis), but the schedule does consider other child-rearing expenditures. To date, there is no evidence to suggest that this has indeed occurred, although there is research that suggests that childcare expense have increased substantially since the pandemic began.⁵⁵ As an aside, one of the major contributing factors is a shortage of childcare workers.

Inflation can have unequal effects on low and high-income families. Low-income families devote a larger budget share to necessities than higher-income families do. They do not have the same ability to cut expenditures on luxury items or dip into savings to offset the rising cost of necessities as higher-income families do. Unequal price changes across goods and services may cause changes in the composition of what families consume.

In all, the impact of the pandemic on child-rearing expenditures and a child support schedule is unknown. If only inflation were considered, it would increase, but there are too many factors to consider (e.g., changes in the cost of childcare and the child's healthcare) and changes in income tax rates, which affect spendable income. It is anticipated though that the changes will not be uniform across all incomes and family sizes.

Overview of the Consumer Expenditure (CE) Survey

Each BR study used more current Consumer Expenditure (CE) data. The 1990 study relied on the 1980–1886 CE, and the 2021 study relied on the 2013–2019 CE. Conducted by the U.S. Bureau of Labor Statistics (BLS), the CE is a comprehensive and rigorous survey with over a hundred-year history.⁵⁶ Today, the CE surveys about 6,000 households per quarter on hundreds of expenditures items.⁵⁷ Households stay in the survey for four quarters, yet households rotate in and out each quarter. The primary purpose of the CE is to calibrate the market basket used to measure changes in price levels over time. Committed to producing data that are of consistently high statistical quality, relevance, and timeliness, the BLS closely monitors and continuously assesses the quality of the CE and makes

⁵⁶ U.S. Bureau of Labor Statistics (BLS). (Jun. 28, 2018). *130 Years of Consumer Expenditures*. Retrieved from <https://www.bls.gov/cex/csxhistorical.htm>.

⁵⁷ There are two components to the CE survey. Each starts with a sample of about 12,000 households. One component is a diary survey, and the other is an interview survey. The results from the interview survey are the primary data source for measuring child-rearing expenditures. Nonetheless, the BLS uses both components to cross check the quality of the data. More information can be found at U.S. Bureau of Labor Statistics. (n.d.). *Handbook of Methods: Consumer Expenditures and Income*. p. 16. Retrieved from <https://www.bls.gov/opub/hom/cex/pdf/cex.pdf>.

improvements when appropriate. Some of these improvements have occurred in between BR studies and, hence, can affect differences between BR study years.

The sampling of the CE is not designed to produce state-specific measurements of expenditures.⁵⁸ To expand the CE so it could produce state-specific measurements would require a much larger sample and other resources and would take several years. Instead, Betson develops national measurements of child-rearing expenditures from the CE. Multiple data years are pooled to obtain an adequate sample size. Betson’s sample selection is described more thoroughly his report.

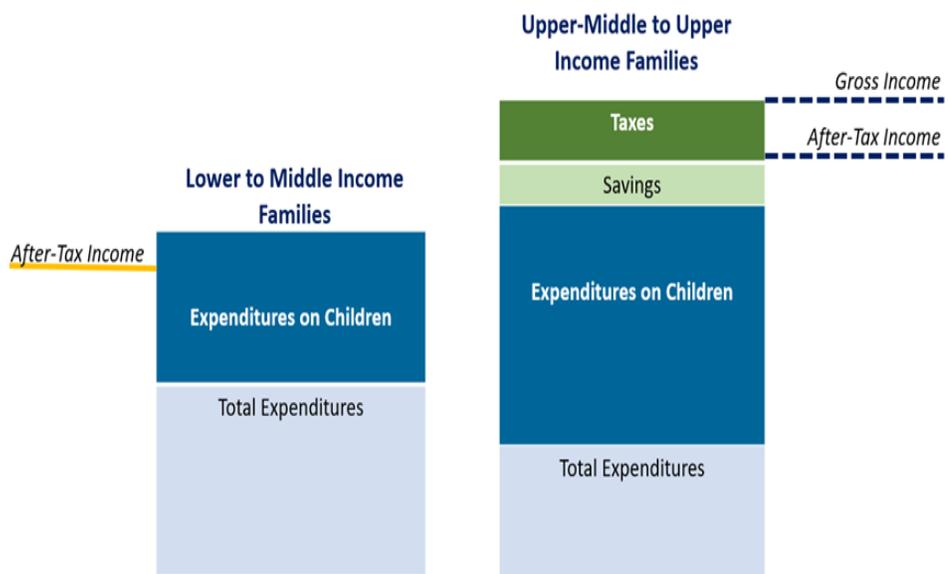

Betson compiles other statistics from the same subset of CE families that he uses to measure child-rearing expenditures. These other statistics are used to develop a child support schedule. This includes the average ratio of expenditures to income, average childcare expenditures, and average healthcare expenses for several income ranges. This additional data is shown and explained in Appendix A.

Changes in the CE

The major change in the CE since the BR4 study was conducted is an improvement to how taxes were measured. In prior surveys, households would self-report taxes. The BLS learned that families underestimated taxes paid, particularly at high incomes; hence, their after-tax income (spendable income) was smaller than measured. Beginning in 2013, the BLS began using their internal tax calculator to calculate each household’s taxes. This effectively reduced the after-tax income available for expenditures. In turn, this affected the average ratio of expenditures to after-tax income, which is used in the conversion of the measurement of child-rearing expenditures to a child support schedule, increased. (This can be illustrated through

Exhibit 6: Relationship between Expenditures and Income

Error! Reference source not found., by assuming a drop in the after-tax income line for the cluster of families to the right that have higher incomes.) This increases the amounts from BR4 to BR5 for high-income families because they pay a larger amount of taxes. Their after-tax income is less; hence, the ratio of expenditures to after-tax income is larger.

⁵⁸ Recently, however, the BLS has been creating state-specific samples for some of the larger states (e.g., California, Florida, and Texas).

Changes in the BR Measurements over Time

Changes to the Betson-Rothbarth (BR) measurements of child-rearing expenditures over time may reflect actual changes in how much families spend on their children, sampling differences in the different study years, changes in the underlying expenditures data used to develop the measurements, or a combination of these factors. In addition, changes in other factors (e.g., the ratio of expenditures to after-tax income) considered in the conversion of the BR measurements, which are expressed as a percentage of total household expenditures, to a gross income-based schedule affect changes to schedule amounts. Understanding the root of the changes is important to Rhode Island if the state updates its schedule using the BR 2021 study.

The two major factors in determining child support are the number of children and the incomes of the parties. Child support schedules provide higher amounts when there are more children because the economic evidence on child-rearing expenditures finds more is spent when there are more children. Further, the economic evidence suggests some economies of scale: expenditures for two children are not twice that of expenditures for one child; rather, they are less than double.

Income follows a similar pattern—that is, economic evidence finds that higher incomes spend more on children and the schedule amounts reflect that. Underlying the premise of most state guidelines is that if the child has a parent living outside the home whose income affords that parent a higher standard of living, the child should share that parent’s standard of living. (Obviously, the situation is more complicated in shared physical parenting situations, but that adjustment is layered on to the schedule through a formula that is applied later in the child support calculation.)

Comparisons by Number of Children

The five Betson studies using the Rothbarth methodology were published in 1990,⁵⁹ 2000,⁶⁰ 2006,⁶¹ 2010,⁶² and 2021.⁶³ Exhibit 7 compares the percentage of total family expenditures devoted to child-rearing for the five BR studies, where BR1 stands for the first study, BR2 stands for the second study, and so forth. Each study uses more current CE data. Exhibit 7 shows the percentages for one, two, and three children. The sample size of families with four or more children is too small to produce measurements for larger families. Instead, as discussed in Appendix A, equivalence scales are used to adjust the measurements for larger family sizes.

Exhibit 7 shows small variation in the percentage of total expenditures devoted to one child over time. The difference between the lowest and the highest estimate for one child is less than two percentage points. This is less than the standard deviation in the estimates due to sampling variation.

Exhibit 7: Comparisons of Betson-Rothbarth (BR) Measurements over Time

For two and three children, Exhibit 7 shows the percentage of total expenditures devoted to child-rearing expenditures increasing slightly over time. However, Betson suggests that expenditures for two and three children should be examined in context of marginal expenditures—that is, starting with expenditures for the first child, how much more was spent for the second child? If the same amount is spent, the marginal increase in expenditures is 100%. If the amount is less than 100%, there is some economies of scale to having more children. The BR studies find that the marginal increase in expenditures from one to two children is about 40–55%, depending on the age of the study, and that the marginal increase in expenditures from two to three children is about 15–23%, depending on the age of the study. Generally, the older studies have smaller marginal increases, while the more recent studies have larger marginal increases. This suggests that the economies of scale of having more children is decreasing slightly. In turn, this suggests slightly larger increases to updated schedule amounts for more children.

Comparisons by Income Ranges

There are at least two caveats to using Exhibit 7 to imply the impact of using more current BR measurements.

- Exhibit 7 compares the measurements as percentages of total household expenditures. As discussed later, this base—total household expenditures—is converted to after-tax (net) income, then converted to a gross-income basis, which is the foundation of the Rhode Island child support schedule. As discussed in more detail in Appendix A, they are converted to net income using the

average expenditures to net income ratios of the same families from the 2013–2019 CE data that Betson used to prepare his most recent estimates.

- Exhibit 7 compares the measurements for *all* child-rearing expenditures including expenditures for the child’s healthcare expenses and childcare expenses. The current Rhode Island schedule does not include the cost of the child’s health insurance, the child’s extraordinary medical expenses (e.g., out-of-pocket expense for an ambulance), or work-related childcare expenses. These expenses are subtracted out of the BR measurements using average expenditures for health care and childcare for the same families from the 2013–2019 CE data. (This is also discussed in Appendix A.)

Exhibit 8, Exhibit 9, and Exhibit 10 compare the BR5 amounts over a larger income range and with childcare and the child’s extraordinary medical expenses subtracted. The exhibits also compare the USDA measurements updated to 2022 price levels. The exhibits show two alternative methods for adjusting the BR5 measurements for RI’s higher housing expenses/cost of living. (Adjusting for Rhode Island above-average housing costs/prices is discussed in more detail in a later step.) Briefly, one way is to simply adjust for Rhode Island’s price parity; the other is to retain the assumption used in 2017. As shown in the exhibits, the adjustment mechanism affects the schedule amount.

More importantly, the exhibits show that at low and middle incomes, the BR5-schedule amounts (regardless of the Rhode Island adjustment mechanism) track closely to the existing schedule and sometimes exceed the existing schedule, and at other incomes are less than the existing schedule. It is not clear whether the small difference is due to sampling error, which is inherent to any statistical analysis; an increase in healthcare expenses and childcare expenses that could cause some substitution away from other expenditure items for the child, which would reduce the amounts; a difference in the gap between Rhode Island and U.S. average housing cost; an actual change in child-rearing expenditures; another factor; or a combination of these factors. At higher incomes, the BR5-based schedules clearly produce amounts greater than the existing schedule at very high incomes. The exhibits also show that the USDA measurements produce amounts significantly higher than the existing and BR5-based schedule amounts. This is because the USDA finds that child-rearing expenditures are more than the BR5 amounts. This is not surprising because, as mentioned earlier, most conventional economists believe that the Rothbarth methodology understates actual child-rearing expenditures. It should also be noted that the exhibits only show the USDA-based schedule extending to combined gross incomes of about \$18,000 per month. This is because there is insufficient information at higher incomes to know the rate of decrease in child-rearing expenditures. Specifically, the dollar expended on children increases as income increases, but the percentage of income decreases. Some attorneys call this the two-pony rule: a child can only ride one pony, not two; so at some point, child-rearing expenditures do not increase at the same rate with more income.

The Lewin/ICF method⁶⁴ suggests that a guidelines amount between the lowest of credible estimates (which would be the Rothbarth-based schedules in the exhibits) and the highest of the credible estimates (which would be the USDA-based schedule) can assess the appropriateness and adequateness of the guidelines amount. Using this approach, the exhibits suggest that the existing schedule amounts

⁶⁴ Lewin/ICF. (1990). *Estimates of Expenditures on Children and Child Support Guidelines*. Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. Fairfax, VA.

are definitely too low at very high incomes, and sometimes too low or appropriate at low to middle incomes.

Exhibit 8: Comparisons for One Child

Exhibit 9: Comparisons for Two Children

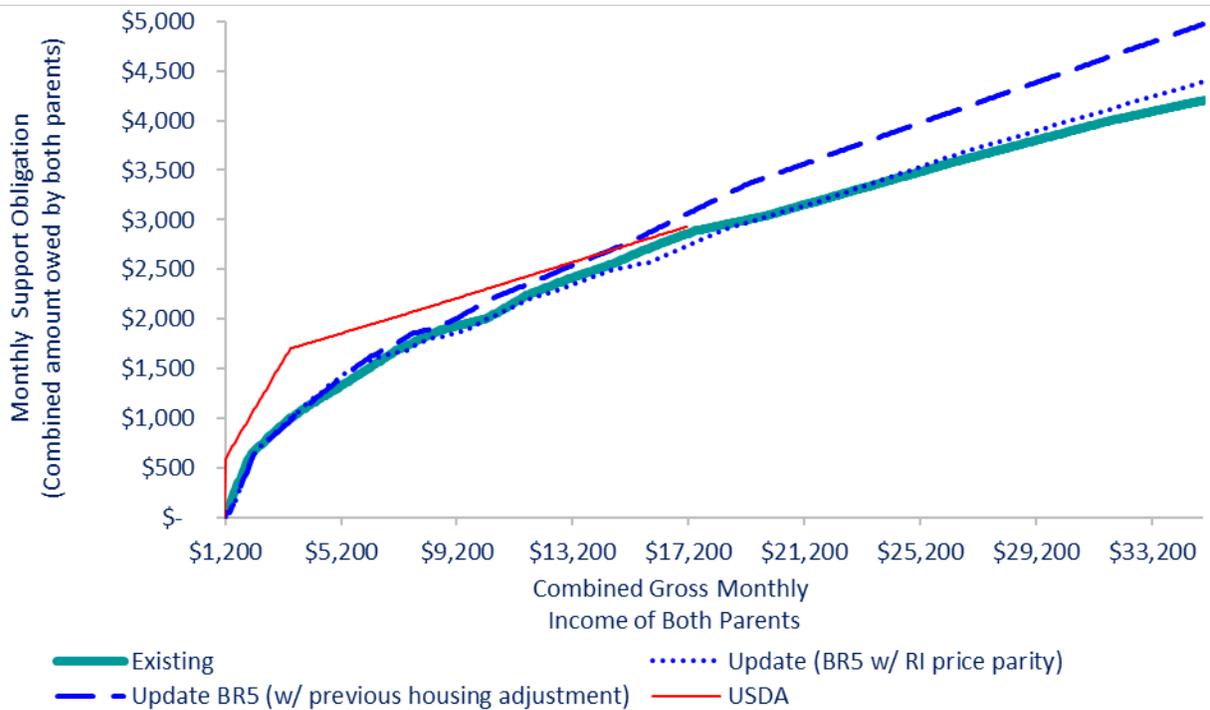

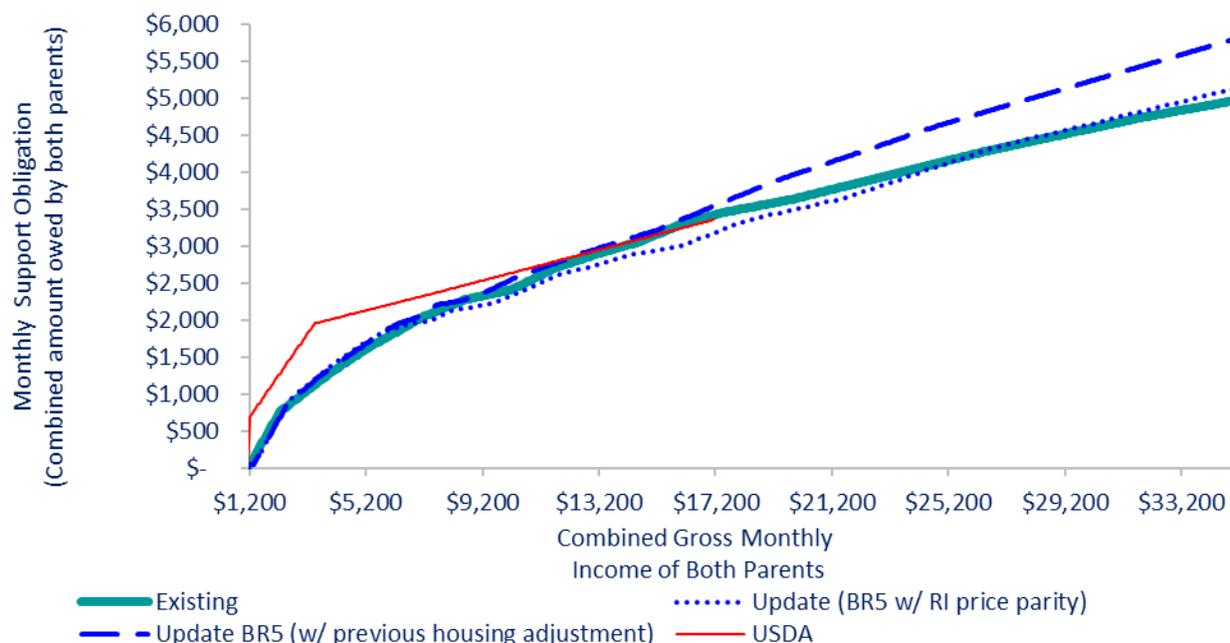

Exhibit 10: Comparisons for Three Children

Factor 3: Adjust to Current Price Levels

The existing schedule is based on price levels from January 2017. The most current price level data available when the proposed schedule was from August 2022. Prices have increased by 22.0% between the two time periods. This does not mean a 22.0% increase in the schedule amounts because some of the increase is offset by incomes that have also increased over time.

To be clear, the Task Force began reviewing the economic data in January 2022. Due to rapid inflation at the time, they decided to update for the most current month that price levels were available after they recessed for the summer and reconvened in Fall 2022. At the time, August 2022 were the most current price levels.

Factor 4: Adjust for Rhode Island Prices/Housing Costs

For the last two guidelines reviews, the Task Force deliberated an appropriate adjustment to the national measurements of child-rearing expenditures for Rhode Island’s higher housing expenses. Over time, two adjustments were made: one at lower incomes (combined incomes of about \$6,000 per month or less) and another at incomes above that. The adjustment at lower incomes considered differences in median gross rents (with utilities) between Rhode Island and the U.S. average using the 2017 U.S. Census American Community Survey (ACS).⁶⁵ The adjustment for incomes above \$6,000 assumed that families spend 10% more of their after-tax income to account for Rhode Island’s higher mortgage costs.

The challenges to updating these adjustments are housing expenses were known to have changed drastically since the COVID-19 pandemic began in 2020, and data were not yet available on those

⁶⁵ U.S. Census American Community Survey. Retrieved from <http://census.data.gov>.

changes. For example, when the Task Force began meeting, the most current ACS rents were from 2019. The 2019 data showed that Rhode Island median gross rent was \$1,043 per month, while it was \$1,097 nationally. In short, Rhode Island rents were *not* more than the U.S. average. This did not appear to align with the pandemic's housing prices because of massive out-migration from densely populated areas to less densely populated areas as well as to warmer climates. The Rhode Island Real Estate Association tracks sale prices of homes. It found about a 14% increase in housing prices in the last year.⁶⁶ However, this only affects new homes, not the cost of existing homes.

At the time that was report was written, which was after the Task Force's deliberation, 2021 ACS data became available: it showed the median gross rent was \$1,191 nationally and \$1,142 in Rhode Island, and that the median monthly home cost of owner-occupied housing was \$1,174 per month nationally and \$1,602 in Rhode Island. In other words, there is not a significant difference between Rhode Island levels and national levels in gross rents, but there is a significant difference in monthly owner-occupied housing costs.

Rhode Island Price Parity

Another consideration was using the same adjustment across all incomes instead of two different methods (i.e., the existing schedule is adjusted for Rhode Island rents at low incomes and presuming that higher incomes spend 10% more of their after-tax income to compensate for Rhode Island housing costs at high incomes). Instead of trying to capture differences in housing expenses, several states with above- or below-average cost of living or income have turned to their state's price parity to adjust the national data on the cost of raising children. The U.S. Bureau of Economic Analysis (BEA) tracks and publishes price parity.⁶⁷ It measures state and regional variation in prices including housing expenses. For every \$1.00 spent on the U.S. on average, \$1.018 is needed for the same level of expenditures in Rhode Island in 2020. In other words, Rhode Island's price parity is 101.8%. This suggests increasing the schedule by 1.8%. Arkansas, Kentucky, Maryland, Nebraska, and New Mexico use their state's respective price parity to adjust the national data in the development of their child support schedule.

There are five different measures of price parity: all items (which is 101.8% for Rhode Island), economic goods (which is 98.0 for Rhode Island), housing (which is 108.4 for Rhode Island), utilities (which is 97.7 for Rhode Island), and other services (which is 102.6 for Rhode Island). The advantages of using price parity are it considers all goods and services, not just housing; it is a credible measure of regional price differences using a sound methodology; it is an adjustment that can be easily explained; it can be applied to all income levels; and it is updated each year. The limitations are that it lags about two years (e.g., the 2020 price parity numbers were released December 2021), and it produces some decreases due to the change in methodology. To overcome these limitation, the existing schedule amounts are retained when the updated schedule (including the adjustment for Rhode Island price parity) suggests a lower amount. This is justifiable for several reasons. Rampant inflation prevails. There is a lag in when

⁶⁶ The Rhode Island Realtors. (various dates). *New and Market Data*. Retrieved from <https://www.rirealtors.org/news/2/>.

⁶⁷ U.S. Bureau of Economic Analysis. (2021). *2020 Regional Price Parities by State (US = 100)*. Retrieved from <https://www.bea.gov/data/prices-inflation/regional-price-parities-state-and-metro-area>.

inflation numbers are published; the schedule is updated for the Task Force to review; and, if the Court adopts the Task Force’s recommendation, when the schedule is promulgated. In light of this, any decreases would be insensible. Further, the Rothbarth methodology is noted to understate actual child-rearing expenditures, so amounts above the Rothbarth methodology are appropriate. As noted in the Lewin/ICF report, any guidelines amount between the lowest credible measurement (which would be the Rothbarth estimates) and the highest credible measurement (which would be the USDA estimates) is an appropriate guidelines amount. Retaining the existing amounts when they are lower than the newest Rothbarth estimates will be between the lowest and the highest estimates.

Factor 5: Exclude Childcare Expenses and Out-of-Pocket Healthcare Costs

The measurements of child-rearing expenditures cover *all* child-rearing expenditures, including childcare expenses and the out-of-pocket healthcare expenses for the child. This includes out-of-pocket insurance premiums on behalf of the child and out-of-pocket, unreimbursed medical expenses exceeding the ordinary amounts included in the schedule such as copays for emergency room visits. These expenses are widely variable among cases (e.g., childcare expenses for an infant are high, and there is no need for childcare for a teenager). Instead of putting them in the schedule, the actual amounts of the expenses are or can be addressed on a case-by-case basis within the guidelines. To avoid double-accounting in the schedule, these expenses are subtracted from the measurements when developing the existing and updated schedules. Appendix A provides the technical details on how this is done.

Inclusion of \$250 per Child per Year for Out-of-Pocket Medical Expenses

There is an exception to excluding the child’s healthcare expenses from the schedule. An amount to cover ordinary, out-of-pocket healthcare expenses (e.g., aspirin and copays for well visits) was retained in both the existing and updated schedules. The current schedule assumes up to \$250 per child per year for ordinary, out-of-pocket healthcare expenses. That assumption is retained for the proposed, updated schedule because the average is still near \$250 per child per year. The concern, however, is the amount varies significantly among those with Medicaid and those with private insurance, particularly with high deductibles. The 2015 Medical Expenditure Panel Survey (MEPS) finds that the average out-of-pocket medical expense per child was \$248 per year but varied depending on whether the child was enrolled in public insurance such as Medicaid or had private insurance. Based on MEPS data, out-of-pocket medical expenses averaged \$63 per child per year for children who had public insurance and \$388 per child per year for those with private insurance.⁶⁸ The 2017 MEPS data, which is the most current available, has not drilled down to the public insurance and private insurance level, but they do report an average for all children, \$271 per child, which is close to the \$250 level.

Some states are responding to the disparity in out-of-pocket expenses between those with public insurance and those with private insurance in two ways. One way is to include *no* ordinary, out-of-pocket medical expenses (e.g., Connecticut and Virginia) in their schedules. This would reduce the

⁶⁸ U.S. Department of Health & Human Services Agency for Healthcare Research and Quality. (n.d.). *Medical Expenditure Panel Survey*. Retrieved from https://www.meps.ahrq.gov/mepsweb/data_stats/meps_query.jsp.

schedule amounts. This means parents must share receipts for *all* out-of-pocket medical expenses, not just those exceeding \$250 per child per year. The major pro of this approach is it more accurate. The major cons are that it requires more information sharing and coordination between the parties and that the burden falls on the parent incurring the expense. The parent incurring the expense must save receipts, notify the other parent, and initiate an enforcement action if the other party fails to pay his or her share. In addition to including no ordinary, out-of-pocket medical expenses in the schedules, Michigan and Ohio take the method one step further. Not only do they exclude all healthcare expenses from the schedule, but they provide a standardized amount of out-of-pocket medical expenses that is added in the worksheet as a line item similar to the add-on for childcare expenses. That amount can vary depending on whether the insurance is private insurance or Medicaid enrollment.

Exhibit 11 illustrates how this works in Ohio, which uses annual income. The pros to this approach are that it can better address the out-of-pocket healthcare expenses and does not require a change in the schedules to update the standardized amount for out-of-pocket medical expenses. The cons are that it makes the calculation more cumbersome and requires knowledge of whether the children are enrolled in Medicaid (which may change frequently).

Although there is concern about the treatment of healthcare expenses, no alternative emerges as clearly superior and more appropriate than the current approach.

Exhibit 11: Illustration of Ohio’s Alternative Approach to Out-of-Pocket Medical Expenses

Worksheet Calculation				Cash Medical Obligation	
	Parent A	Parent B	Combined	Number of Children	Annual Cash Medical Amount
1. Annual Income	\$40,000.00	\$40,000.00	\$80,000.00	1	\$388.70
2. Share of Income	50%	50%		2	\$777.40
3. Schedule Amount (Annual)			\$20,000.00	3	\$1,166.10
4. Annual Cash Medical			\$388.70	4	\$1,554.80
5. Total Obligation			\$20,388.70	5	\$1,943.50
6. Each Parent’s Share (Line 2 x Line 5)	\$10,194.35	\$10,194.35		6	\$2,332.20

Factor 6: Conversion of Expenditures to After-Tax Income

Factors 6 and 7 are necessary because the BR measurements are expressed as a percentage of total expenditures; hence, they must be translated into a gross-income basis, which is the basis of the child support schedule. The need for this conversion to the BR measurements is illustrated by **Error! Reference source not found.** that shows some families spend more or less than their income. As stated earlier, Betson reports the measurements of child-rearing expenditures as a percentage of total expenditures. Thus, they must be converted from a percentage of total expenditures to a gross-income basis because the child support schedule relates to gross income. This is a two-step process. The first step is converting expenditures to net income.

The conversion was done by taking the expenditures-to-income ratio for the same subset of CE families used to develop the measurements of child-rearing expenditures for both the existing and proposed child support schedules. The ratios from the most recent BR5 study are shown in Appendix A, as well as an example of how the conversion is made. An exception is made at lower incomes, because as shown in Exhibit 6, they spend more than their after-tax income on average.

This conversion method is common among most income shares guidelines. The only known exception is that the District of Columbia assumes that all after-tax income is spent and, hence, makes no adjustment. (This results in larger schedule amounts that become progressively larger as income increases.) There is no compelling reason for Rhode Island to adapt the District of Columbia approach.

Factor 7: Conversion to Gross Income

After the BR measurements of child-rearing expenditures are converted to after-tax income as described above, then they are converted to gross income. This is because the schedule considers the gross incomes of the parties. For both the existing and updated schedules, the conversion to gross income relies on the federal withholding formula⁶⁹ and state income tax rates.⁷⁰ The federal withholding formula also considers FICA. The Social Security and Medicare tax is 6.2% for incomes up to \$147,000 per year. Above that level, the Medicare tax of 1.45% applies. In addition, the 0.9% additional Medicare tax for incomes above \$200,000 per year is also considered.

The federal income withholding formula provides for different formulas depending on which year of the IRS W-4 form the employer uses to calculate income tax withholding. The alternative formulas produce the same amounts at lower and middle incomes, but there are slight differences at very high incomes. The IRS developed alternative methods to accommodate sweeping tax reform that became effective January 1, 2018, due to the Tax Cuts and Jobs Act of 2017 (Pub. L. 115-97), which increased the standard deduction and repealed personal exemptions. Earlier IRS W-4 forms still accommodate personal exemptions; the 2020 and later W-4 forms do not. It is assumed that the 2020 W-4 (or later) form is used and the manual percentage method formula for a single taxpayer is used. For state income taxes, one exemption is used. This is consistent with the federal withholding formula and previous conversions.

Using federal and state income tax withholding formulas and assuming all income is taxed at the rate of a single tax filer with earned income is a common assumption among most states and the assumption underlying the existing Rhode Island schedule. Most alternative federal tax assumptions would result in more after-tax income—hence, higher schedule amounts. For example, the District of Columbia assumes the tax-filing status is for a married couple claiming the number of children for whom support is being determined. The District used this assumption prior to 2018 tax reform that eliminated the federal tax allowance for children and expanded the federal child tax credit from \$1,000 per child to \$2,000 per child and higher for tax year 2021. The 2018 federal tax changes are scheduled to expire in 2025. Appendix C shows the gross to net conversion table.

⁶⁹ IRS Publication 15-A: Federal Income Tax Withholding Methods: 2022. Retrieved from <https://www.irs.gov/pub/irs-pdf/p15.pdf>.

⁷⁰ State of Rhode Island Division of Taxation. (n.d.). 2022 Rhode Island Employer's Income Tax Withholding Table. Retrieved from https://tax.ri.gov/sites/g/files/xkgbur541/files/2021-12/2022-withholding-booklet_12222021.pdf.

Since the income conversion assumes single tax filing status, there is no adjustment for the child tax credit or the Earned Income Tax Credit (EITC). The child tax credit would be impossible to include in the schedule since it applies to one parent and that parent's income must be within a certain range to receive the full child tax credit and another range to receive a partial child tax credit (which the IRS calls the additional child tax credit). In contrast, the schedule considers the combined gross income of the parents. Say the combined income of the parents is \$150,000 per year. If the parents have equal incomes (\$75,000 per year), either parent's income would make them income-eligible for the full child tax credit. Say, however, that the obligated parent's income is \$150,000 and the other has no income, the parent without income would not be income-eligible for the child tax credit. The EITC is not considered because it is a means-tested program. Most states do not consider mean-tested income to be income available for child support.

The pro of considering an alternative tax assumption such as assuming the tax-filing status is married better aligns with the economic measurements of child-rearing expenditures because the measurements consider households in which the parents and children live together, so they would probably file as a married couple. They also could be set up to include the federal child tax credit, the additional child tax credit, the earned income tax credit, or a combination of these child-related tax credits. The cons are that this would be a change in the previous assumption that is not necessarily justifiable and may not be consistent with current practices.

Factor 8: Incorporate the Self-Support Reserve and Minimum Order

The purpose of the self-support reserve (SSR) is to allow the payer-parent a remaining amount of income after the payment of child support and taxes to live at a sustainable level. Rhode Island's SSR fulfills the 2016-added federal requirement (45 C.F.R. § 302.56(c)(1)(ii)) that a state's guidelines must consider the subsistence needs of the parent.

For the Rhode Island schedule, the SSR is compared to after-tax income, which is a hidden column in the schedule. If the difference between after-tax income and the SSR is less than the obligation amount, an adjustment is made. The existing schedule incorporates a SSR equivalent to the 2017 federal poverty guidelines (FPG) for one person (\$1,005 per month). The proposed schedule is updated to include the 2022 FPG, which is \$1,133 per month.

There are a couple of other adjustments to the SSR. A minimum order of \$50 per month applies. For the phase-out of the SSR, only a percentage of the difference between the after-tax income and the SSR is applied to the schedule amount. This allows for a work incentive—that is, for each dollar earned, some of it is retained by the obligated parent and not all of it is assigned to child support. The adjustment percentages are 90 percent for one child, 91 percent for two children, 92 percent for three children, 93 percent for four children, 94 percent for five children, and 95 percent for six children.

The SSR is phased out when average child-rearing expenditures for an income is less than the self-support reserve formula. This occurs above monthly gross incomes of \$1,750 for one child, \$2,150 for two children, \$2,500 for three children, and \$2,800 for four children, \$3,100 for five children, and \$3,450 for six children.

SECTION 3: IMPACT OF UPDATING THE SCHEDULE AND SELF-SUPPORT RESERVE

This section considers the impact of updating the child support schedule and the self-support reserve (SSR). It uses case scenarios to examine the impact of updating the schedule. Appendix D provides side-by-side comparisons of the existing and proposed schedules. The new economic data allows the schedule to be extended from combined adjusted gross incomes of \$35,000 to \$40,000 per month.

Exhibit 12 shows the average and median change above the SSR-adjusted area of the updated schedule. These are changes to the schedule amount—that is, the amount owed by both parents. In other words, this is before the obligated parent’s share is determined. The average change is about 1–2%, but more at higher incomes (6–8%) depending on the number of children. The modest change reflects more current economic data and a change in how the national economic data are adjusted for Rhode Island’s cost of living. The proposed schedule uses Rhode Island’s price parity, which measures how much more prices are in Rhode Island than they are nationally. Price parity is a more consistent and stable adjustment mechanism particularly given fluctuations in housing cost data since the COVID-19 pandemic began and the time lags in when housing cost data becomes available.

Exhibit 12: Average and Median Changes above the SSR for Updated Schedule

	One Child		Two Children		Three Children		Four Children		Five Children		Six Children	
Average Change	\$42	2%	\$24	1%	\$18	1%	\$14	1%	\$15	1%	\$17	1%
Median Change	\$31	2%	\$0	0%	\$0	0%	\$0	0%	\$0	0%	\$0	0%
Minimum Change	\$0	0%	\$0	0%	\$0	0%	\$0	0%	\$0	0%	\$0	0%
Maximum Change	\$105	9%	\$102	8%	\$104	7%	\$113	6%	\$124	6%	\$135	6%

To consider the impact of the proposed schedule, information about typical incomes and number of children is helpful. The 2021 U.S. Census American Community survey finds the median income of Rhode Island married-couple families with children is \$122,141 per year, about 14% of Rhode Island married-couple families have incomes less than \$50,000 per year, and about 19% have incomes more than \$200,000 per year. Although specific Rhode Island numbers are not available, most states find that over half of their orders are for one child, just under half are for two children, and about 10 percent are for three or more children.

Updating the SSR reduces the schedule amounts below monthly gross incomes of \$1,750 for one child, \$2,150 for two children, \$2,500 for three children, \$2,800 for four children, \$3,100 for five children, and \$3,450 for six children. As noted earlier, federal regulation requires the consideration of the subsistence needs of the payer-parent. Rhode Island’s SSR fulfills that requirement. The current Rhode Island SSR is based on the 2017 federal poverty guidelines (FPG) for one person. The SSR is updated to the 2022 FPG in the proposed schedule. The proposed, updated SSR does not affect one- and two-child order amounts for payer-parents with incomes equivalent to full-time earnings from minimum wage based on the 2023 Rhode Island minimum wage of \$13.00 per hour. It would affect those with three or more children.

The areas of the schedule with no change are:

- For all children: incomes above where the SSR would apply to combined incomes of about \$3,300 to \$3,750 per month, depending on the number of children;
- For one child, there are three additional pockets: combined incomes of about \$7,200 to \$9,100 per month, combined incomes of about \$11,500 to \$14,000 per month, and about \$14,700 to \$17,800 per month; and
- For two and more children, there are no changes at combined incomes of about \$6,700 to \$26,660 per month, but the exact incomes vary slightly depending on the number of children.

When there are increases in the proposed schedule, they are generally modest increases. The areas of the schedule with more than a \$100 per month increase to the basic schedule amount are:

- For one child, combined incomes more than \$28,600 per month;
- For two children, combined incomes more than \$29,650 per month;
- For three children, there are no increases more than \$100 per month;
- For four and more children, there are increases of more than one hundred at combined incomes of about \$5,100 to \$6,100 per month.

COMPARISONS OF CASE SCENARIOS

Exhibit 13 shows the nine case scenarios examined. The first two scenarios assume minimum wage earnings at a 40-hour work week. The 2022 minimum wage is \$12.25 per hour and will increase to \$13.00 per hour in 2023. The median earnings of Rhode Island workers by highest educational attainment and gender are the basis of case scenarios 3–7. Earnings are reported for five levels of educational attainment and gender for Rhode Island workers by the U.S. Census 2019 American Community Survey. Male median earnings are used as the incomes of the obligated parent in the scenarios and female median earnings are used for the receiving party’s income. The last two scenarios consider high incomes. There are no adjustments to base support or deductions from income for special factors such as the cost of the child’s health insurance premium or substantial shared physical custody.

The comparisons also consider the guidelines of neighboring states. Exhibit 14 compares the guidelines basis of Rhode Island to that of nearby states and other state characteristics. All the states shown in the exhibit rely on the income shares model, albeit New York’s classification is questionable. New York claims to be based on the income shares model, but it really is percentage-of-obligor income guidelines—that is, base support can be calculated as a percentage of income (i.e., 17% for one child, 25% for two children, 29% for three children, 31% for four children, and 35% for five children) as long as the combined income is below New York’s high-income threshold of below \$163,000 per year. The New York percentages can be applied above that income, but they are no longer presumptive.

Exhibit 13: Summary of Case Scenarios Used to Compare Impact of Updated Schedule

Case Scenario	Gross Monthly Income of Paying-Parent	Gross Monthly Income of Receiving Party
1. Minimum wage earner (\$12.25 per hour in 2022) at 40 hours per week	\$2,123	\$2,123
2. Minimum wage earner (\$13.00 per hour in 2023) at 40 hours per week	\$2,253	\$2,253
3. Parent’s earnings are equivalent to median earnings of Rhode Island workers with less than a high school education	\$2,980	\$2,428
4. Parent’s earnings are equivalent to median earnings of Rhode Island workers whose highest educational attainment is a high school degree or GED	\$3,521	\$2,598
5. Parent’s earnings are equivalent to median earnings of Rhode Island workers whose highest educational attainment is some college or an associate’s degree	\$4,090	\$3,018
6. Parent’s earnings are equivalent to median earnings of Rhode Island workers whose highest educational attainment is a college degree	\$5,357	\$4,236
7. Parent’s earnings are equivalent to median earnings of Rhode Island workers whose highest educational attainment is a graduate degree	\$7,473	\$5,693
8. High earners (combined income = \$25,000)	\$12,500	\$12,500
9. High earners (combined income = \$30,000)	\$20,000	\$10,000

In contrast, Rhode Island and Connecticut use the standard income shares model that evolved from the 1987 National Child Support Guidelines Project that was convened by the federal Office of Child Support Enforcement to meet a congressional mandate to provide technical assistance to states to fulfill a new federal requirement for statewide guidelines.⁷¹ New Hampshire and Massachusetts each have their own unique version of income shares. As shown in Exhibit 14, Rhode Island and Connecticut, like the majority of states, rely on Betson-Rothbarth (BR) estimates of child-rearing expenditures. The University of New Hampshire researchers who developed the existing New Hampshire guidelines percentages claim to have used estimates of child-rearing expenditures based on Venohr (2006),⁷² who is the economist of this study, and would have used BR estimates, but the New Hampshire percentages do not fully track with the referenced study.

2022 State Minimum Wage	\$7.25	\$12.35	\$13.00	\$14.95	\$7.25	\$13.20
2020 Price Parity (All Items)	100.0	101.8	103.4	107.4	103.7	110.2
2020 Price Parity (housing)	100.4	108.4	116.6	132.2	116.6	135.1

New York relies reduced the amounts from a 1981 study to account for three factors: the potential additional earning capacity of the custodial parent, the payer-parent’s visitation expenses, and what a noncustodial parent could reasonably pay but still be fair and adequate.⁷³ Massachusetts does not strictly relate to economic data; rather, although its task force considered the 2021 BR study, it also considered “a range of legal, policy and practical considerations” when recommending changes to its chart⁷⁴ that was eventually adapted. The Massachusetts guidelines produce amounts higher than many states.⁷⁵

Exhibit 14 also compares incomes and housing costs across the five states that are compared. Rhode Island consistently ranks the lowest among the states in income, housing costs, and price parity.

Graphical Comparisons

Exhibit 15, Exhibit 16, and Exhibit 17 compare scenarios 1–5 for one, two, and three children, respectively. Exhibit 18, Exhibit 19, and Exhibit 20 compare scenarios 6–9 for one, two, and three children.

The general findings are summarized below.

- There are no reductions. None of the case scenarios are affected by the proposed update to the self-support reserve.
- There are increases for the first four scenarios, which are low incomes. The increases are never more than \$54 per month.
- There are no changes for the middle-income scenarios (cases 5–7). This is due to switching to price parity to adjust for Rhode Island prices. This is the income most affect by the housing cost assumption.
- There are generally increases for the last two scenarios involving very high incomes. The increase is never more than \$70 per month.

SECTION 4: SUMMARY AND CONCLUSIONS

Rhode Island is reviewing its child support guidelines. This report reviews the economic data on the cost of raising children and uses it to prepare an updated child support schedule. Federal regulation requires the consideration of economic data on the cost of raising children. This report demonstrates that Rhode Island has met that federal requirement.

Besides economic data on the cost of raising children, there are many factors that go into the development and update of a child support schedule. The existing Rhode Island schedule is based on a national study of child-rearing expenditures published in 2010, updated to 2017 price levels, adjusted to account for 2017 federal and state income tax rates and FICA (since expenditure decisions are made based on after tax income), adjusted for Rhode Island housing costs, and to include a self-support reserve based on the 2017 federal poverty guidelines for one person. Federal regulation requires the consideration of the subsistence needs of the payer-parent through a self-support reserve or another mechanism. Rhode Island's self-support reserve fulfills the federal requirement.

The proposed schedule is based on an updated study of child-rearing expenditures using more current expenditures data, but the same methodology to separate the child's share of expenditures from total household expenditures. That study also represents child-rearing expenditures at a national level, so is adjusted for 2022 federal and state income tax rates and FICA, and Rhode Island's price parity. Price parity is used instead of adjustment to account for Rhode Island's housing expenses because of the lack of current data on the difference between Rhode Island and national housing prices. The available evidence, which is about two years old, suggests that the gap between Rhode Island and U.S. average housing prices has narrowed. Further, housing prices have changed drastically since the COVID-19 pandemic began and are still changing. Price parity is a measure developed and tracked by the U.S. Bureau of Economic Analysis. It not only reflects how state or regional housing prices differ from the national average, but also reflects how state or regional prices differ from the national average for all items. The proposed, updated schedule also reflects 2022 prices and includes a self-support reserve based on the 2022 poverty guidelines for one person.

Updating the self-support reserve would produce decreases at very low incomes; however, it would not affect parents with incomes equivalent to earnings from a 40-hour work week at minimum wage. For incomes above where the self-support reserve applies, the average increase would be 1%, and the maximum increase would be 9%. Using more current economic data allows for the highest income considered in the schedule to increase from combined incomes of \$35,000 per month to \$40,000 per month.

In all, these are modest increases. Still, the increases could make a difference to a child's life. Updating the low-income adjustment (which is a self-support reserve based on the 2017 federal poverty guidelines for one person) would also be fair and just to low-income parents required to pay support.

APPENDIX A: TECHNICAL DOCUMENTATION OF THE UPDATED SCHEDULE

There are several technical considerations and steps taken to update a child support schedule. Exhibit A-1 shows the national data that Betson provided CPR to convert the BR5 measurements to a child support schedule that is adjusted for Rhode Island prices using Rhode Island’s price parity.

Overview of Income Ranges

For Exhibit A-1, Betson provided CPR with information for 25 income ranges that were generally income intervals of \$5,000 to \$20,000 per year. CPR collapsed a few of them to average out some anomalies (e.g., a spike in the percentage of total expenditures devoted to child-rearing expenditures once childcare and extraordinary medical expenses were excluded from a particular income range). The collapsing resulted in the 20 income ranges shown in Exhibit A-1.

Exhibit A-1: Parental Expenditures on Children and Other Expenditures by Income Range Used in the BR5 Measurements (National Data)

Annual After-Tax Income Range (2020 dollars)	Number of Observations	Total Expenditures as a % of After-Tax Income	Expenditures on Children as a % of Total Consumption Expenditures (Rothbarth 2013–2019 data)			Childcare \$ as a % of Consumption (per child)	Total Excess Medical \$ as a % of Consumption	
			1 Child	2 Children	3 Children		(per capita)	(total)
\$ 0 – \$19,999	283	>200%	22.433%	34.670%	42.514%	0.473%	0.870%	3.005%
\$20,000 – \$29,999	306	134.235%	23.739%	36.642%	44.893%	0.437%	0.894%	3.208%
\$30,000 – \$34,999	306	107.769%	24.057%	37.118%	45.462%	0.407%	1.047%	3.722%
\$35,000 – \$39,999	409	103.780%	24.222%	37.364%	45.755%	0.647%	1.390%	4.878%
\$40,000 – \$44,999	428	100.064%	24.362%	37.571%	46.002%	0.721%	1.468%	5.301%
\$45,000 – \$49,999	416	97.195%	24.452%	37.705%	46.161%	0.747%	1.539%	5.485%
\$50,000 – \$54,999	399	92.716%	24.509%	37.789%	46.261%	0.855%	1.609%	5.887%
\$55,000 – \$59,999	367	90.548%	24.580%	37.894%	46.386%	1.210%	2.166%	7.389%
\$60,000 – \$64,999	335	86.130%	24.615%	37.945%	46.447%	0.776%	2.071%	7.474%
\$65,000 – \$69,999	374	84.016%	24.668%	38.025%	46.541%	1.255%	2.114%	7.525%
\$70,000 – \$74,999	333	82.671%	24.725%	38.108%	46.640%	1.586%	2.121%	7.375%
\$74,999 – \$84,999	615	82.690%	24.820%	38.249%	46.807%	1.743%	2.343%	7.894%
\$85,000 – \$89,999	318	78.663%	24.863%	38.311%	46.880%	1.392%	2.155%	8.331%
\$90,000 – \$99,999	565	76.240%	24.912%	38.384%	46.966%	1.658%	2.000%	7.888%
\$100,000 – \$109,999	493	75.488%	24.996%	38.508%	47.113%	2.159%	1.946%	7.121%
\$110,000 – \$119,999	374	73.058%	25.054%	38.593%	47.213%	2.523%	1.942%	7.583%
\$120,000 – \$139,999	468	71.731%	25.142%	38.722%	47.365%	2.477%	1.893%	6.494%
\$140,000 – \$159,999	240	70.658%	25.266%	38.904%	47.579%	3.073%	1.855%	7.516%
\$160,000 – \$199,999	512	62.753%	25.322%	38.986%	47.676%	1.790%	1.806%	7.037%
\$200,000 or more	498	58.427%	25.571%	39.350%	48.103%	2.459%	1.554%	6.501%

DETAILED STEPS USED TO ARRIVE AT SCHEDULE

The steps used to convert the information from Exhibit A-1 to the updated schedule is generally the same steps used to develop prior Rhode Island schedules except the national data is adjusted for Rhode Island’s prices using price parity, which is discussed in more detail later.

The steps are presented in the order they occur, not in the order of the factors discussed in Section 3.

The steps consist of:

Step 1: Exclude childcare expenses.

Step 2: Exclude child's healthcare expenses except up to the first \$250 per year per child that is used to cover ordinary, out-of-pocket medical expenses for the child.

Step 3: Adjust for ratio of expenditures to after-tax income.

Step 4: Update for current price levels.

Step 5: Develop marginal percentages.

Step 6: Extend measurements to four and more children.

Step 7: Adjust for Rhode Island price parity.

Step 8: Convert to gross income.

Step 9: Adjust for current schedule amounts being more.

Step 10: Incorporate the self-support reserve (SSR).

Step 1: Exclude Childcare Expenses

Childcare expenses are excluded because the actual amount of work-related childcare expenses is considered in the guidelines calculation on a case-by-case basis. The actual amount is considered because of the large variation in childcare expenses: the childcare expense is none for some children (e.g., older children) and substantial for others (e.g., infants in center-based care). Not to exclude them from the schedule and to include the actual amount in the guidelines calculation (typically as a line item in the worksheet) would be double accounting.

Starting with the expenditures on children, which is shown in fourth column of Exhibit A-1, average childcare expenses are subtracted from the percentage of total income devoted to child-rearing. For example, at combined incomes of \$60,000 to \$64,999 net per year, 37.945 percent of total expenditures is devoted to child-rearing expenditures for two children. Childcare comprises 0.776 percent of total expenditures per child. The percentage may appear small compared to the cost of childcare, but it reflects the average across all children regardless of whether they incur childcare expenses. Childcare expenses may not incur because the children are older, a relative provides childcare at no expense, or another situation.

The percentage of total expenditures devoted to childcare is multiplied by the number of children (e.g., 0.776 multiplied by children is 1.552%). Continuing with the example of a combined income of \$60,000 to \$64,999 net per year, 1.552 percent is subtracted from 37.945 percent. The remainder, 36.393 (37.945 minus 1.552 equals 36.393), is the adjusted percentage devoted to child-rearing expenditures for two children that excludes childcare expenses.

One limitation is that the CE does not discern between work-related childcare expenses and childcare expenses the parents incurred due to entertainment (e.g., they incurred childcare expenses when they went out to dinner.) This means that work-related childcare expenses may be slightly overstated. In

turn, this would understate the schedule amounts. Similarly, if there are economies to scale for childcare, multiplying the number of children by the percentage per child would overstate actual childcare expenses. When subtracted from the schedule, this would reduce the schedule too much. However, due to the small percentage devoted to childcare expenses, any understatement is likely to be small.

Step 2: Exclude Medical Expenses

A similar adjustment is made for the child's medical expenses except an additional step is taken. Exhibit A-1 shows the excess medical percentage, which is defined as the cost of health insurance and out-of-pocket medical expenses exceeding \$250 per person per year. It is shown two ways: the per-capita amount and the average amount for the entire household. Either way considers expenditures on the two adults in the household. It is adjusted to a per-child amount since medical expenses of children are less. The underlying data do not track whether the insurance premium or medical expense was made for an adult's or a child's healthcare needs.

Based on the 2017 National Medical Expenditure survey, the annual out-of-pocket medical expense per child is \$270, while it is \$615 for an adult between the ages of 18 and 64.⁷⁶ In other words, an adult's out-of-medical expenses is 2.28 more than that of a child's. This information is used to recalibrate the per-person excessive medical amount shown in Exhibit A-1 to a per-child amount. For example, at combined incomes of \$60,000 to \$64,999 net per year, the total excess medical expense is 7.474 percent. The adjusted child amount is 7.474 divided by the weighted amounts for family members (6.1684 based on 2.28 times two adults plus the average number of children for this income range, 1.6084). The quotient, 1.212 percent, is the per-child amount for excess medical. It is less than the per-capita amount of 2.071 percent.

Continuing from the example in Step 1, where 36.393 is the percentage that excludes childcare for two children at a combined income of \$60,000 to \$64,999 net per year, 1.212 multiplied by two children is subtracted to exclude the children's excessive medical expenses. This leaves 33.969 as the percentage of total expenditures devoted to raising two children, less childcare expenses and excess medical expenses.

Step 3: Convert to After-Tax Income

The next step is to convert the percentage from above to an after-tax income by multiplying it by expenditures to after-tax income ratios. Continuing using the example of combined income of \$60,000 to \$64,999 net per year, the ratio is 86.130. When multiplied by 33.969, this yields 29.257 percent of after-tax income being the percentage of after-tax income devoted to raising two children, excluding childcare and excess medical expenses.

Step 4: Adjust to Current Price Levels

The amounts in Exhibit A-2 are based on May 2020 price levels. They are converted to August 2022 price levels using changes to the Consumer Price Index (CPI-U), which is the most commonly used price

⁷⁶ Agency for Healthcare Research and Quality. (Jun. 2020). *Mean expenditure per person by source of payment and age groups, United States, 2017. Medical Expenditure Panel Survey*. Generated interactively: June 12, 2020, from https://www.meps.ahrq.gov/mepstrends/hc_use/.

index.⁷⁷ The adjustment is applied to the midpoint of each after-tax income range. Exhibit A-2 shows the midpoint in January 2022 dollars.

Exhibit A-2: Table of Proportions for One, Two, and Three Children

Annual After-Tax Income Range (May 2020 dollars)	Annual Midpoint of Income Range (Jan. 2022 Dollars)	One Child		Two Children		Three Children

Step 5: Develop Marginal Percentages

In this step, the information from the previous steps is used to compute a tax table-like table of proportions for one, two, and three children that is shown in Exhibit A-2. The percentages from above (e.g., 29.257% for two children for the combined income of \$60,000 to \$64,999 net per year in 2020 dollars) are assigned to the midpoint of that income range adjusted for inflation (\$68,534 in 2022 dollars). Marginal percentages are created by interpolating between income ranges. For the highest income range, the midpoint was supplied by Betson: \$258,887 per year in May 2020 dollars.

Another adjustment was made at low incomes. The percentages for incomes below \$30,000 net per year were less than the amounts for the net income range \$30,000 to \$34,999 per year. This is an artificial result caused by the cap on expenditures in Step 3 because families of this income range spend more than their after-tax income on average. Decreasing percentages result in a smooth decrease when the parent receiving support has more income. This is the general result of the steps so far. The exception is at low incomes because of the cap. Without the cap, it will also produce decreasing percentages. For the purposes of the child support schedule, the percentage from the \$30,000 to

⁷⁷ U.S. Bureau of Labor Statistics. (n.d.). *Consumer Price Index*. Retrieved from https://www.bls.gov/regions/mid-atlantic/data/consumerpriceindexhistorical_us_table.htm.

\$34,999 net income bracket are applied to all incomes less than \$30,000 net per year. For one child, the percentages are from the \$35,000 to \$39,999 net income range. To be clear, this is still less than what families of this income range spend on children.

Step 6: Extend to More Children

Most of the measurements only cover one, two, and three children. The number of families in the CE with four or more children is insufficient to produce reliable estimates. For many child support guidelines, the National Research Council's (NRC) equivalence scale, as shown below, is used to extend the three-child estimate to four and more children.⁷⁸

$$= (\text{number of adults} + 0.7 \times \text{number of children})^{0.7}$$

Application of the equivalence scale implies that expenditures on four children are 11.7 percent more than the expenditures for three children, expenditures on five children are 10.0 percent more than the expenditures for four children, and expenditures on six children are 8.7 percent more than the expenditures for five children.

Step 7: Adjust for Rhode Island Price Parity

The percentages in Exhibit A-3 are increased to account for Rhode Island's 2020 price parity, which is 101.8 percent.⁷⁹ In other words, the calculations so far are multiplied by 101.8, which is a 1.8 percent increase.

Step 8: Convert to Gross Income

The final step is to convert the schedule to a gross-income base. This is done by calculating the after-tax incomes for the gross incomes appearing in the schedule. The after-tax income equivalent is shown as a hidden column in Exhibit A-3. The schedule amounts are calculated based on the after-tax income using the information in Exhibit A-2 for one, two, and three children adjusted for Rhode Island price parity. The amounts for four and more children are calculated from the three-child amounts in Exhibit A-2 multiplied by the equivalence scales shown in Step 6.

As identified in Section 3, the conversion to gross income relies on the federal and state withholding formulas.⁸⁰ The federal withholding formula also considers FICA. The Social Security and Medicare tax is 6.2 percent for incomes up to \$147,000 per year. Above that level, the Medicare tax of 1.45 percent applies. In addition, the 0.9 percent additional Medicare tax for incomes above \$200,000 per year is also considered. The IRS formula assume a manual calculation using a current IRS W-4 form. (The IRS the form in 2020 to reflect 2018 federal tax reform that increased the standard deduction and repealed personal exemptions.) It is assumed that the tax filing status is single.

4069	5200	944	1425	1709	1909	2100	2283

Using federal and state income tax withholding formulas and assuming all income is taxed at the rate of a single tax filer with earned income is a common assumption among most states and the assumption underlying previous Rhode Island schedules. Most alternative federal tax assumptions would result in more after-tax income—hence, the higher schedule amounts. For example, the District of Columbia assumes the tax-filing status is for a married couple claiming the number of children for whom support is being determined. The District used this assumption prior to 2018 tax reform that eliminated the federal tax allowance for children and expanded the federal child tax credit from \$1,000 per child to \$2,000 per child and higher for tax year 2022. The 2018 federal tax changes are scheduled to expire in 2025.

Since the income conversion assumes single tax filing status, there is no adjustment for the child tax credit or the Earned Income Tax Credit (EITC). The child tax credit would be impossible to include in the schedule since it applies to one parent and that parent’s income must be within a certain range to receive the full child tax credit and another range to receive a partial child tax credit (which the IRS calls the additional child tax credit). In contrast, the schedule considers the combined gross income of the parents. Say the combined income of the parents is \$150,000 per year. If the parents have equal incomes (\$75,000 per year), either parent’s income would make them income-eligible for the full child tax credit. Say, however, that the obligated parent’s income is \$150,000 and the other has no income, the parent without income would not be income-eligible for the child tax credit. The EITC is not considered because it is a means-tested program. Most states do not consider mean-tested income to be income available for child support.

The pro of considering an alternative tax assumption such as assuming the tax-filing status is married better aligns with the economic measurements of child-rearing expenditures because the measurements consider households in which the parents and children live together, so they would probably file as a married couple. They also could be set up to include the federal child tax credit, the additional child tax credit, the earned income tax credit, or a combination of these child-related tax

credits. The cons are that this would be a change in the previous assumption that is not necessarily justifiable and inconsistent application.

Step 9: Adjust for Existing Amounts Being More

As shown in Appendix B, there were some anomalous decreases to the update, particularly due to the change from adjusting the national data for Rhode Island’s higher housing expenses to use Rhode Island’s price parity. Any decrease would be inconsistent with the rampant inflation that was occurring. Further, there were other reasons to justify not making the decreases. The Rothbarth methodology is known to understand actual child-rearing expenditures. The USDA methodology suggested increases to the existing schedule amount. Due to these reasons, the current amounts were retained when they were more than the BR amounts. In addition, there was some smoothing of the amounts just above the self-support reserve to create a gradual transition as income increases.

Step 10: Adjust for the SSR and the Minimum Order

A self-support reserve (SSR) is incorporated into the schedule. The existing schedule incorporates a SSR of \$1,007, which is the 2017 federal poverty guidelines (FPG) for one person. The schedule is updated for the 2022 FPG for one person (\$1,133). When after-tax income is below the SSR, a \$50 percent minimum order is shown. The minimum order also applies to incomes slightly above that to account for payment of the minimum order. The SSR is phased out by comparing the difference between the obligor’s after-tax income and the SSR weighted by a “work incentive” to the BR-calculated amount, and the lower of the two is put in the schedule. The work incentive ensures that not every additional dollar in income is assigned to child support. Instead, 90 percent of the difference is assigned for one child and one additional percentage is assigned for each additional child (e.g., 91% for two children, 92% for three children, and so forth, up to 95% for six children). The area adjusted for the SSR is shown by the shaded area of the schedule.

CONSUMER EXPENDITURE DATA

Most studies of child-rearing expenditures, including the BR measurements, draw on expenditures data collected from families participating in the Consumers Expenditures Survey (CE) that is administered by the Bureau of Labor Statistics (BLS). Economists use the CE because it is the most comprehensive and detailed survey conducted on household expenditures and consists of a large sample. The CE surveys about 7,000 households per quarter on expenditures, income, and household characteristics (e.g., family size). Households remain in the survey for four consecutive quarters, with households rotating in and out each quarter. Most economists, including Betson, use three or four quarters of expenditures data for a surveyed family. This means that family expenditures are averaged for about a year rather than over a quarter, which may not be as reflective of typical family expenditures.

In all, the BR5 study relies on expenditures/outlays data from almost 14,000 households, in which over half had a minor child present in the household. The subset of CE households considered for the BR5 measurements used to develop the existing updated schedule consisted of married couples of child-rearing age with no other adults living in the household (e.g., grandparents), households with no change in family size or composition during the survey period, and households with at least three completed interviews. Other family types were considered, which also changed the sample size, but the percentage

of child-rearing expenditures in these alternative assumptions did not significantly change the percentage of expenditures devoted to child-rearing expenditures. The other family types included in these expanded samples were households with adult children living with them and domestic partners with children.

The CES asks households about expenditures on over 100 detailed items. Exhibit A-5 shows the major categories of expenditures captured by the CE. It includes the purchase price and sales tax on all goods purchased within the survey period. In recent years, the CE has added another measure of “expenditures” called “outlays.” The key difference is that outlays essentially include installment plans on purchases, mortgage principal payments, and payments on home equity loans, while expenditures do not. To illustrate the difference, consider a family who purchases a home theater system during the survey period, puts nothing down, and pays for the home theater system through 36 months of installment payments. The expenditures measure would capture the total purchase price of the home theater system. The outlays measure would only capture the installment payments made in the survey period.

The BLS designed the CE to produce a nationally representative sample and samples representative of the four regions (Midwest, Northeast, South, and West). The sample sizes for each state, however, are not large enough to estimate child-rearing costs for families within a state. We know of no state that has seriously contemplated conducting a survey similar to the CE at a state level. The costs and time requirements would be prohibitive.

Transportation expenses account for about one-sixth of total family expenditures. In the category of “transportation,” the CES includes net vehicle outlays; vehicle finance charges; gasoline and motor oil; maintenance and repairs; vehicle insurance; public transportation expenses; and vehicle rentals, leases, licenses, and other charges. The net vehicle outlay is the purchase price of a vehicle less the trade-in value. Net vehicle outlays account for just over one-third of all transportation expenses. Net vehicle outlays are an important consideration when measuring child-rearing expenditures because the family’s use of the vehicle is often longer than the survey period. In Betson’s first three studies, he excluded them because in his earlier estimates that consider expenditures the vehicle can be sold again later, after the survey period. In contrast, Betson’s 2020 estimates that consider outlays capture vehicle payments made over the survey period. The USDA, which relies on expenditures, includes all transportation expenses including net vehicle outlays. There are some advantages and disadvantages to each approach. Excluding it makes sense when the vehicle may be part of the property settlement in a divorce. An alternative to that would be to include a value that reflects depreciation of the vehicle over time, but that information is not available. Including the entire net vehicle outlay when expenditures are used as the basis of the estimate likely overstates depreciation. When the basis of the estimates is outlays, it includes only vehicle installment payments rather than net vehicle outlays. This effectively avoids the issues of vehicle equity and depreciation.

Exhibit A-4: Partial List of Expenditure Items Considered in the Consumer Expenditure Survey

Housing	Rent paid for dwellings, rent received as pay, parking fees, maintenance, and other expenses for rented dwellings; interest and principal payments on mortgages, interest and principal payments on home equity loans and lines of credit, property taxes and insurance, refinancing and prepayment charges, ground rent, expenses for property management and security, homeowners' insurance, fire insurance and extended coverage, expenses for repairs and maintenance contracted out, and expenses of materials for owner-performed repairs and maintenance for dwellings used or maintained by the consumer unit. Also includes utilities, cleaning supplies, household textiles, furniture, major and small appliances, and other miscellaneous household equipment (tools, plants, decorative items).
Food	Food at home purchased at grocery or other food stores, as well as meals, including tips, purchased away from home (e.g., full-service and fast-food restaurants, vending machines).
Transportation	Vehicle finance charges, gasoline and motor oil, maintenance and repairs, vehicle insurance, public transportation, leases, parking fees, and other transportation expenditures.
Entertainment	Admission to sporting events, movies, concerts, health clubs, recreational lessons, television/radio/sound equipment, pets, toys, hobbies, and other entertainment equipment and services.
Apparel	Apparel, footwear, uniforms, diapers, alterations and repairs, dry cleaning, sent-out laundry, watches, and jewelry.
Other	Personal care products, reading materials, education fees, banking fees, interest paid on lines of credit, and other expenses.

Betson excludes some expenditure items captured by the CE because they are obviously not child-rearing expenses. Specifically, he excludes contributions by family members to Social Security and private pension plans, and cash contributions made to members outside the surveyed household. The USDA also excludes these expenses from its estimates of child-rearing expenditures.

Gross and net incomes are reported by families participating in the CE. The difference between gross and net income is taxes. In fact, the CE uses the terms "income before taxes" and "income after taxes" instead of gross and net income. Income before taxes is the total money earnings and selected money receipts. It includes wages and salary, self-employment income, Social Security benefits, pension income, rental income, unemployment compensation, worker's compensation, veterans benefits, public assistance, and other sources of income. Income and taxes are based on self-reports and not checked against actual records.

The BLS has concerns that income may be underreported in the CE. Although underreporting of income is a problem inherent to surveys, the BLS is particularly concerned because expenditures exceed income among low-income households participating in the CE. The BLS does not know whether the cause is underreporting of income or that low-income households are actually spending more than their incomes because of an unemployment spell, the primary earner is a student, or the household is otherwise withdrawing from its savings. To improve income information, the BLS added and revised income questions in 2001. The new questions impute income based on a relationship to its expenditures when households do not report income. The 2010 and 2020 Betson-Rothbarth measurements rely on these new questions. Previous Betson measurements do not.

The BLS also had concerns with taxes being underreported. Beginning in 2013, the BLS began calculating taxes for families using a tax calculator, rather than relying self-reported amounts. This also affected differences between the BR5 measurements and earlier measurements.

The BLS also does not include changes in net assets or liabilities as income or expenditures. In all, the BLS makes it clear that reconciling differences between income and expenditures and precisely measuring income are not parts of the core mission of the CES. Rather, the core mission is to measure and track expenditures. The BLS recognizes that at some low-income levels, the CES shows that total expenditures exceed after-tax incomes, and at very high incomes, the CES shows total expenditures are considerably less than after-tax incomes. However, the changes to the income measure, the use of outlays rather than expenditures, and use of the tax calculator have lessened some of these issues.

APPENDIX B: PROPOSED, UPDATED CHILD SUPPORT SCHEDULE

The shaded area is where the self-support reserve (SSR) is incorporated. The SSR has been updated from the 2017 federal poverty guidelines (FPG) for one person to the 2022 FPG. The SSR fulfills the federal requirement for a low-income adjustment. The amounts adjusted for the SSR are lower than the economic evidence of child-rearing expenditures.
